Registering for Support

Access the erwin support site and click Sign in to register for product support.

Accessing Technical Support

For your convenience, erwin provides easy access to "One Stop" support for all editions of erwin Data Modeler, and includes the following:

- Online and telephone contact information for technical assistance and customer services
- Information about user communities and forums
- Product and documentation downloads
- erwin Support policies and guidelines
- Other helpful resources appropriate for your product

Chapter 1: Modeling in the Multiuser Environment

erwin® Data Modeler Workgroup Edition coordinates the development and management of data models created with erwin® Data Modeler.

This section contains the following topics

- erwin Data Modeler Workgroup Edition (see page 11)
- Model Life Cycle Frameworks (see page 12)

erwin Data Modeler Workgroup Edition

erwin Data Modeler Workgroup Edition provides a multiuser modeling environment that makes coordinated, large-scale modeling possible. It enables collaboration among project managers, data modeling team members, and standards administrators by providing workgroup modeling services, including conflict resolution, versioning, security, and standards management. You can coordinate the efforts of model teams to document existing systems, create new eBusiness systems, and drive data standardization. Model sharing encourages teamwork, so modelers can work together more efficiently to optimize model-based development. Your modelers get more work done in less time with better results.

Workgroup modeling operates in a three-tier architecture, where erwin Data Modeler connects to Mart server through a web server. The models are held in a database or Mart; you can use Microsoft SQL Server, Oracle, PostgreSQL, or SAP ASE as the host database.
Workgroup modeling features are provided to help control updates to models when you are opening, closing, and saving models. The administrator installs the program and initializes the database on the DBMS server. The administrator also has the responsibility of setting up the library structure in which models are organized, and assigning security profiles to users. After a model is saved to the database, control of who can work on the model and how changes are saved to the model is handled by profiles, making it possible for workgroups to work on large models without confusion. erwin Data Modeler Workgroup Edition supports many security and administrative features related to its multiuser capabilities. For this reason, routine management is usually performed by a dedicated administrator. Administrators can find detailed information regarding their tasks and responsibilities in the Administration Guide.

You can also use erwin Data Modeler Navigator Edition with erwin Data Modeler Workgroup Edition. Read-only access is permitted to data models, so your workgroup can use this to share information with others without the risk that unauthorized changes might be saved to Mart.

**Model Life Cycle Frameworks**

Use one of the following model life cycle frameworks in your organization:

**Model-Driven Development**

Changes to the schema are made to the model first and then forward-engineered.

**System-Driven Models**

Changes are made directly to the schema and the schema is reverse-engineered into the model to reflect the changes.

**Informational Models**

Contains logical-only models, enterprise-wide models, or standards and sample models.

Each type of framework has different considerations that you must think about when configuring your database and developing its supporting policies. You are not required to choose a particular framework, however, it helps to know your development process before building a library structure.
Model-Driven Development Framework

In the model-driven framework, the model is always the source of all changes. You create a new database schema by forward engineering the model. The life cycle of a model in the model-driven Development framework can follow a path like this:

- Create the library structure (for example, Development, Test, and Production) and populate them with erwin® Data Modeler templates.
- Create the logical model in a development library.
- Promote the model to the test library when it is ready.
- Generate the schema from the test library.
- Modify the test model as required and synchronize it to the schema.
- Promote the model to the production library when it is ready.
- Publish the refreshed production model.
- Update the enterprise-wide model, if necessary.
- Incorporate changes into the development model for further changes, and repeat the process.

System-Driven Model Framework

In the system-driven framework, there is an established information system from which you can reverse engineer database tables. The life cycle of a model in the system-driven Development framework can follow a path as described below:

- Create the library structure (for example, Reverse Eng, Test, Production). You do not require erwin® Data Modeler templates because you do not create models from scratch.
- Reverse engineer the model from the information system into the designated library.
- Enhance the model with logical information and input from analysts.
- Update the model to reflect changes in the physical schema.
- Create a version of the model.
- Synchronize the schema and the model using Complete Compare.
- Publish the model.
- Repeat the last three steps as the system is modified.
Informational Model Framework

In the Informational Model framework, erwin Data Modeler Workgroup Edition contains logical-only models, enterprise-wide models, or standards and sample models. There is no forward engineering with the intent of using the schema. The life cycle of a model in the Informational Model framework can follow a path as described below:

- Create the library structure and populate them with templates.
- Develop the initial model. Use reverse engineering and model new components as required.
- Publish the initial model to the appropriate parties for modification and refinement.
- Get approval, and then version the model.
- Publish the approved model.
- Update and publish models as the enterprise model evolves.
Chapter 2: Install and Configure an Oracle Mart

This section describes how you can install and configure a Mart on an Oracle database.

This section contains the following topics

- How to Install and Configure an Oracle Mart (see page 16)
- How to Upgrade any r9 Series Mart to the Current Version (see page 39)
- Change the Mart Database Server (see page 46)
- Troubleshooting (see page 46)
How to Install and Configure an Oracle Mart

In the previous versions, erwin DM connected to the Mart database through the database client software. Now, the application connects to the Mart database through a web server. The database client software is no longer required.

The Mart comprises the following components:

Database
Stores the user data for the Workgroup Edition. You can use an Oracle 10g, 11g, 12c, or the certified version 12c R2 database for the Mart database. If you are using Oracle 12c, you can use a pluggable database. You must use a new database and not an existing database that was created for an older version of the data modeling tool.

Applications
Includes a web-based component named erwin Mart Administrator that helps you manage the Mart through a web console.

Web server
Hosts erwin Mart Administrator. You can use a web server of your choice. If you have not installed a web server, use the erwin Mart Server option and install Tomcat.
Complete the following steps in the same order to install and configure the Mart:

1. Review the Prerequisites for an Oracle Mart.
2. Create the Mart Database and perform the additional tasks. (see page 23)
3. Install erwin Mart Server.
4. Use MartServer as a Windows Service.
5. Initialize an Oracle Mart.
6. Log in to erwin Mart Administrator and configure settings.
7. Use a Pluggable Database. (see page 37)
Mart Architecture

In the previous versions, erwin DM connected to the Mart database through the database client software. Now, the application connects to the Mart database through a web server. The database client software is no longer required. The web server includes a web-based administration console—erwin Mart Administrator. If you are using the Workgroup Edition, you must install and configure erwin Mart Administrator.

The Mart comprises the following components:

**Database**
Stores the user data for the Workgroup Edition. You can use an Oracle 10g, 11g, 12c, or the certified version 12c R2 database for the Mart database. If you are using Oracle 12c, you can use a pluggable database. You must use a new database and not an existing database that was created for an older version of the data modeling tool.

**Applications**
Includes a web-based component named erwin Mart Administrator that helps you manage the Mart through a web console.

**Web server**
Hosts erwin Mart Administrator. You can use a web server of your choice. If you have not installed a web server, use the erwin Mart Server option and install Tomcat.

The following diagram shows the new architecture:
The new architecture has the following benefits:

- Separate logical and physical users: In the previous versions, Mart (or Model Manager) users required database level privileges to access the Mart functionality. The Mart database administrators added or deleted users in the Mart database. This approach is changed now. The logical users are separated from physical users, so Mart Administrators can create the Mart users without creating the corresponding database users.

- Authentication through Active Directory services: Earlier, if you wanted to provide access to a user group, you added each user individually. Now, because of the new architecture, you can use the Active Directory services and can provide access to the group. Anyone who is part of the group gets access.

- Mart administration outside erwin® Data Modeler: In the previous versions, Mart Administrators used erwin® Data Modeler for administrative activities such as managing permissions. This required non-modelers to know how to use erwin® Data Modeler. In the new architecture, the administration component is built on a separate layer on top of erwin® Data Modeler and is hosted on a web server. Mart Administrators can access erwin Web Admin from any computer and can perform administrative activities through a web console.

**Install a Mart or Upgrade a Mart?**

Use the following guidelines to determine if you must install a Mart or upgrade a Mart:

- If you are new to erwin® Data Modeler and have purchased the current version of Workgroup Edition, then install the current version of the Mart. Use the How to Install and Configure a Mart procedure that is appropriate for your Mart database.

- If you have any earlier release of r9 series Mart, then upgrade the Mart to the current version. Use the How to Upgrade any r9 Series Mart to the Current Version procedure to upgrade your Mart. The models that are created in any earlier release of r9 series are upgraded when a user connects to the current version Mart and opens the models.

- If you have an existing Mart and the version is r7.3 through r8.2.9, install the current version Mart. Use the How to Install and Configure a Mart procedure that is appropriate for your Mart database. After installing the Mart, use the Upgrade Mart utility to upgrade the Mart models from r7.3 through r8.2.9 to the current version.
Review the Prerequisites for an Oracle Mart

Before you install the Mart components, help ensure that the minimum system requirements that are outlined in this topic are met.

You can use any of the following combinations to install erwin® Data Modeler, the Mart database, and the MartServer application:

- Install erwin Data Modeler, the Mart database, and the MartServer application on the same computer.
- Install erwin Data Modeler, the Mart database, and the MartServer application on different computers.
- Install erwin Data Modeler and the Mart database on one computer, and install the MartServer application on a different computer.
- Install erwin Data Modeler on one computer, and install the Mart database and the MartServer application on a different computer.

Ensure that you always install the MartServer application on Windows operating system.

System requirements for installing the MartServer application

Hardware requirements (based on physical hardware performance, not a virtual environment):

Hardware requirements (based on physical hardware performance, not a virtual environment):

- 2 GHZ or higher dual core processor
- 4 GB RAM (8 GB or more for large marts)
- 4 GB of disk space or more as required to support your specific mart
Operating system:
- Microsoft Windows Server 2008 SP2, R2
- Microsoft Windows 7 SP1
- Microsoft Windows 8.1
- Microsoft Windows 10
- Microsoft Windows Server 2012, R2
- Microsoft Windows Server 2016
- Microsoft .NET Framework 3.5 and above
- All current Microsoft Windows critical updates are applied

Database:
- The Mart Server can use a standalone or can share an existing database server for an Oracle 10g, 11g, 12c, or the certified version 12c R2 database. If you are using Oracle 12c, you can use a pluggable database.
- To create the Mart, you must be the database schema owner user and you must have the DBA role in the target database on the Oracle server. The DBA role is required for the user who is specified in the Configure MartServer dialog. If the DBA privilege of this user is revoked, then erwin DM users will not be able to save model changes to the Mart.
- (Optional) You have modified the following parameters in the initialization file (InitSID.ora):
  - Remote_OS_Authent="T"
  - OS_Authent_Prefix=TRUE
- (Optional) To use the Korean language with the Mart database, use KO16MSWIN949 or AL32UTF8 character set depending on your operating system language pack. For more information, see the Oracle documentation.

erwin Mart Administrator web client:
Supported browsers:
- Microsoft Internet Explorer v10® or newer
- Mozilla Firefox® v30 or newer
- Google Chrome v30 or newer
- Apple Safari 6 or newer
Other requirements

Help ensure that the following additional requirements are met:

- If you want to use Microsoft IIS as the web server, you have configured it.
- The DBMS is installed and prepared for creating the Mart Database.
- The Mart database is created. At least one user with administrator privileges is present. You have run the initial queries on the Oracle database. For more information about the initial queries, see the Implementation Guide.
- If you want to add Windows Group users as Mart users, you have the Active Directory Server details.

  **Note:** You can add Windows Group users as normal Mart users, but not as Mart administrators. A Mart administrator must be a server or Windows user.

Important disclaimer notice on all requirements

1. The requirements that are mentioned previously define the minimum requirements which permit the application to run with reasonable performance based on a small business use case scenario. The actual requirements for an enterprise-wide use case based on larger models and configurations require significantly greater resources to obtain acceptable performance.

2. These requirements are based on actual physical hardware (no virtual environment) and the following assumptions:

   - Minimal to no network overhead (both the database and application servers are locally installed)
   - Vendor’s default install of the current version of their software (with all current service or fix packs)
   - No other applications sharing the defined hardware configuration (for example, a “clean” machine)

Any other hardware/software configurations are acceptable as long as they provide the same (or better) performance characteristics identified.
Create the Mart Database and Perform the Additional Tasks

Perform the following setup tasks in your DBMS environment before you can install and use the software:

1. Install the DBMS on the server where you plan to store the Mart.
   
   Help ensure that you can create tables, indexes, stored procedures, and public synonyms. For more information about memory and disk space requirements, see the system requirements for each DBMS (Microsoft SQL Server, SAP ASE, PostgreSQL, and Oracle).

2. Create a database that you want to use as the Mart. To use a pluggable database, see the Use a Pluggable Database (see page 37) topic.

   Use the DBMS features to create or identify the required storage objects and the mart. The specific requirements vary depending on your DBMS type.

   **Note:** To create, update, or delete a Mart in erwin Data Modeler Workgroup Edition, you must be the database schema owner and you must have the DBA role.

Additional Tasks

The DBA and the system administrator responsible for installing the software on an Oracle database management system performs these tasks.

Use graphical tools or SQL *Plus (all versions), SQL*DBA, or the Oracle Enterprise Management Console to perform these tasks. Some SQL commands are included where appropriate. The Data file paths, data file sizes, role names, and user names are included as examples only.

1. Check the SYSTEM tablespace.

   The installation creates several stored procedures. All triggers, stored procedures, and packages are kept in the Oracle SYSTEM tablespace. The standard size of the SYSTEM tablespace assumes that you are not using procedural options, so the SYSTEM tablespace must be often expanded. If other Oracle applications are not using procedural code, then expand the SYSTEM tablespace to 32 MB. If other Oracle applications also use procedural code, expand the SYSTEM tablespace to at least 32 MB.

2. Check the Rollback Segment tablespace.

   If your instance uses UNDO tablespace, do not create rollback segments.

   Significant rollback space is required for installing and use. The rollback segments must be in their own separate tablespace and each have at least 16 MB of available space. There must be one rollback segment for every four concurrent users, with a maximum of 50 rollback segments. The available space must scale upward with increasing numbers of rollback segments. Finally, the rollback segment optimal parameter must be set to control rollback segment growth and space consumption.

   **Note:** For Steps 3, 4, and 5, use the Dictionary-managed tablespaces.
How to Install and Configure an Oracle Mart

3. Create a data tablespace of at least 32 MB.
   For example:
   ```
   CREATE TABLESPACE MyMart
   DATAFILE '/db01/oracle/rdbms9i/data/mymart.ora' SIZE 100M;
   Or For Locally Managed extents:
   CREATE TABLESPACE Mymart
   DATAFILE '/db01/oracle/rdbms9i/data/mymart.ora' SIZE 100M
   EXTENT MANAGEMENT LOCAL SEGMENT SPACE MANAGEMENT AUTO;
   ```

4. Create an index tablespace of at least 32 MB.
   For example:
   ```
   CREATE TABLESPACE MMARTINDEX
   DATAFILE '/db02/oracle/rdbms9i/data/mmartindex.ora' SIZE 75M;
   Or For Locally Managed extents:
   CREATE TABLESPACE MMARTINDEX
   DATAFILE '/db02/oracle/rdbms9i/data/mmartindex.ora' SIZE 75M
   EXTENT MANAGEMENT LOCAL SEGMENT SPACE MANAGEMENT AUTO;
   ```

5. Create a temporary tablespace.
   For example:
   ```
   CREATE TEMPORARY TABLESPACE MMTEMP TEMPFILE '/db03/oracle/rdbms9i/data/mmartemp.ora'
   SIZE 50M;
   Or For Locally Managed extents:
   CREATE TEMPORARY TABLESPACE MMTEMP TEMPFILE '/db03/oracle/rdbms9i/data/mmartemp.ora'
   SIZE 50M
   EXTENT MANAGEMENT LOCAL UNIFORM SIZE 1M;
   ```
   **Note:** For more details about syntax and options regarding tablespace creation, see the appropriate Oracle documentation.

6. Create an Oracle user with DBA privileges for use by the erwin® Data Modeler Workgroup Edition installer or designated schema owner.
   Assign the data tablespace to this user as the default tablespace, and the temporary tablespace as the temporary tablespace to the user.
   For example:
   ```
   CREATE USER STEVE IDENTIFIED BY STEVE
   DEFAULT TABLESPACE MyMart
   TEMPORARY TABLESPACE MMTEMP
   QUOTA UNLIMITED ON MyMart
   QUOTA UNLIMITED ON MMARTINDEX;
   ```
7. Create the erwin® Data Modeler Workgroup Edition Installer role.
   The following example is the role that the Oracle user requires to install erwin®
   Data Modeler Workgroup Edition.
   
   ```sql
   CREATE ROLE MMINSTALL;
   ```

8. Grant the Oracle privileges to the Installer role.
   The following example shows the Oracle privileges that the erwin® Data Modeler
   Workgroup Edition Installer must install on Oracle. For the last command, log in as
   sys with the sysdba role in the user-name or the command will fail.
   
   ```sql
   grant create sequence to MMINSTALL;
   grant create table to MMINSTALL;
   grant create view to MMINSTALL;
   grant drop public synonym to MMINSTALL;
   grant create public synonym to MMINSTALL;
   grant create procedure to MMINSTALL;
   grant select on dba_data_files to MMINSTALL;
   ```

   For example:
   
   ```sql
   CREATE ROLE MMUSER;
   ```
   When you select this role as the erwin® Data Modeler Workgroup Edition User role
   during Step 4 of the installation procedure, the Setup program generates grant
   statements. These statements grant the object level privileges to this role.

10. Grant the create session Oracle privilege to the User role.
    For example:
    
    ```sql
    grant create session to MMUSER;
    ```
    **Note:** To use the database, an Oracle user needs only the create session privilege.

11. Grant the erwin® Data Modeler Workgroup Edition User role to the Installer role.
    For example:
    
    ```sql
    grant MMUSER to MMINSTALL;
    ```

    When prompted for tablespace and role information, select the Workgroup Edition data
    tablespace, the Workgroup Edition index tablespace, and the Workgroup Edition User
    role (the role created in Step 9).
Oracle SQL Commands

If a graphical DBMS access tool is not available, you can use Oracle SQL commands through SQL*DBA or SQL*Plus.

Example: Create a tablespace using the CREATE TABLESPACE command

```sql
CREATE TABLESPACE mm_data /* The tablespace name. */
DATAFILE 'C:\ORANT\DATABASE\mmdata.dat' /* The data file name. */
SIZE integer_value K or M or G /* The data file size */
DEFAULT STORAGE ( /* The default storage parameters */
  INITIAL integer_value K or M or G /* The initial extent size */
  NEXT integer_value K or M or G /* The next extent size */
  PCTINCREASE integer_value /* The percent to grow extents */
  MINEXTENTS integer_value /* The minimum number of extents */
  MAXEXTENTS integer_value /* The maximum number of extents */
);
```

Example: Create an Oracle user using the CREATE USER command

```sql
CREATE USER mm_user_1 /* The user id name */
IDENTIFIED BY password /* The user password */
DEFAULT TABLESPACE tablespace_name /* The user's default tablespace */
TEMPORARY TABLESPACE tablespace_name /* The user's temporary tablespace */
QUOTA unlimited_or_integer_K_M_G ON tablespace_name /* The user's quota on a tablespace */
;
```

Example: Grant user privileges using the GRANT command

```sql
GRANT role_or_privilege_name
TO user_or_role
;
```

Install erwin Mart Server

The Mart Server and Mart Admin war files are deployed on a Web server. You can either use an existing web server, or install the web server through the erwin MartServer r9.8 Installation Wizard. You must install erwin Mart Server and configure it regardless of whether you use Mart Server as a Windows service.

Note: Ensure that you have reviewed the Install a Mart or Upgrade a Mart topic before proceeding.
Follow these steps:

1. Do one of the following tasks:
   - Insert the installation DVD and select Mart Server Installation.
   - Download the EDMMS98 (32-bit or 64-bit).exe file from the online erwin product page and run it.
   
The erwin MartServer r9.8(32-bit or 64-bit) Installation Wizard appears.

2. Go through the wizard steps to install erwin Mart Server.
   
   Depending on the options you select, erwin Mart Server and/or Java Runtime Environment (JRE) and Tomcat are installed.
   
   **Note:** If Java (any version) is already available in the computer and the environment variable JRE_HOME is set, the installer overwrites JRE_HOME with the new Java path. The JRE version that is shipped with the installer is 1.8.

3. From the Windows Start menu, click All Programs, erwin, Mart Server r9.8(32-bit or 64-bit), Configure MartServer.
   
   The erwin Mart Configuration dialog appears.

**Configure the erwin Mart Server**

1. Complete the following fields in the Mart Server tab:
   
   **Database Type**
   
   Specifies the database server type.

   **Port No.**
   
   Specifies the port number of the database server.

   **Server Name**
   
   Specifies the name of the database server where you have installed the Mart database. For example, suppose that you are using SQL Server as the Mart database. Enter the name of the computer where SQL Server is installed.
Instance Name

Specifies the name of the database instance.

Database Name

Specifies the name of the Mart database.

Note: If you are installing the Mart for the first time, use a new database. Do not use an existing database that was created for r7.3 through r8.2.9 Mart. If you are upgrading the Mart from any earlier release of r9 series to the latest release, use the corresponding Mart database.

User Name

Specifies the user name to connect to the Mart database. Enter the name of a user that is authenticated by the Mart database.

Note: Windows authentication (User Name field) is not supported for connecting to the Mart database from the Configure Mart Server window.

Password

Specifies the password to connect to the Mart database.

Note: The following fields—Domain Controller Name, Domain/User Name, and Password are required only if you are using the Active Directory authentication. You can use the Active Directory authentication to initialize the Mart and to log in to erwin Mart Administrator.

Domain Controller Name

Specifies the fully qualified name of the Active Directory Server (Domain Controller). Enter the name in the following format:

LDAP://server/distinguished-name

Example: ldap://mktgna:3268/dc=abc, dc=com

Here, mktgna is the server name. You can provide either the name of the server or the IP address. 3268 is the port number to which the server listens. dc=abc, dc=com is the distinguished-name. The distinguished name is the full path of the object.

Note: If you do not know the Domain Controller Name, use the Nltest command or talk to your System Administrator.

Domain/User Name

Specifies the domain name and user name in the <domain name>/<user name> format.

Password

Specifies the password of the domain user.
Configure erwin Mart Administrator

1. Enter the following information in the Mart Administrator tab:

   **Server Name**
   - Specifies the name of the computer where the Web Server is present. For example, if you are using Tomcat, enter the name of the computer where Tomcat is installed.
   - **Default:** localhost

   **Port Number**
   - Specifies the port number on which the Web Server is running.
   - **Default:** 18170

   **Application Name**
   - Specifies the application name with which the Web Server is identified.
   - **Default:** MartServer

   **Transport Layer Security**
   - Specifies if you want to connect to the Mart through a secured connection (SSL). Select this check box if you have implemented SSL.

   **Hosting Server**
   - Specifies that you want to use the IIS web server to connect to the Mart. Select this check box only if you have configured IIS.

   **IIS Port**
   - Specify the IIS port number that you want to use. This field is enabled only if you select the Use IIS check box. The default is 80.

   **Account Lockout Duration (Seconds)**
   - Specify the duration (in seconds) for which an account should be locked whenever an incorrect password is entered five consecutive times. By default, it is set to five minutes (300 seconds). At the most, you can set it to 30 days (2592000 seconds).

2. Click Configure.

   The erwin Mart Administrator and the Mart Server are configured.

**More information:**

- [Configure IIS Web Server](#) (see page 150)
- [Implement SSL for IIS](#) (see page 152)
Enable SSL for Tomcat

SSL enables you to access the Mart through a secured connection. You can enable SSL for Tomcat—the default web server, when you are installing the Mart for the first time.

**Follow these steps:**

1. If the Mart Server service is running, stop it. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8 (32-bit or 64-bit), Stop MartServer Service to stop the web server.

2. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8 (32-bit or 64-bit), Enable SSL for Tomcat Webserver.

   SSL is enabled for Tomcat and a security certificate is created. You must install this security certificate on all the computers from where you want to access the Mart.

3. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8 (32-bit or 64-bit), Configure MartServer.

   The erwin Mart Configuration dialog appears.

4. Go to the Mart Administrator tab and select the Transport Layer Security check box.

5. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8 (32-bit or 64-bit), Start Mart Server Service.

6. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8 (32-bit or 64-bit), erwin Mart Administrator r9.8 (32-bit or 64-bit).

   The erwin Mart Administrator home page appears and displays HTTPS in the address bar. If a certificate error appears, click Proceed Anyway to begin the session.

**Important!** If you want to connect to an SSL enabled Mart through API or the Mart Upgrade utility, you must first install the security certificate on the corresponding computer. Install the certificate through the data modeling tool. If you do not install the security certificate, the Mart Upgrade utility and the API will not be able to connect to the SSL enabled Mart.

**Disable SSL and Access the Mart Through a Normal Connection**

You can disable SSL at any time and access the Mart through a normal connection.

**Follow these steps:**

1. If the Mart Server Service is running, stop it. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8 (32-bit or 64-bit), Stop Mart Server Service.

2. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8 (32-bit or 64-bit), Disable SSL.

3. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8 (32-bit or 64-bit), Configure MartServer.
The erwin Mart Configuration dialog appears.

4. Go to the Mart Administrator tab and clear the Transport Layer Security check box.

5. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8 (32-bit or 64-bit), Start Mart Server Service.

6. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8 (32-bit or 64-bit), erwin Mart Administrator r9.8 (32-bit or 64-bit).

The erwin Mart Administrator home page appears and displays HTTP in the address bar.

**Use Mart Server as a Windows Service**

The current version of the Mart provides two ways to start the web server that hosts Mart Server:

- Start the web server manually.
- Use a Windows service to start the web server.

For example, if you have used Tomcat as the web server to host Mart Server, you can start Tomcat in two ways:

- Start Tomcat through the startup.bat file or through a shortcut to this file.
- Use a Windows service to start Tomcat.

The benefits of using a Windows service to start a web server are as follows:

- Any user with administrative privileges on a computer can start the Windows service, whereas, only designated users can start a web server manually.
- A Windows service runs regardless of whether a user has logged in. A manually-started web server shuts down when the user who started it logs out.

**Follow these steps:**

1. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8(32-bit or 64-bit), Create MartServer Service to create the MartServer Windows service.

Creating the service is a one-time task. After the service is created, you only have to start and stop the service.

2. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8(32-bit or 64-bit), Start MartServer Service to start the web server.
Initialize an Oracle Mart

When you access the Mart database through erwin Mart Administrator for the first time, you must initialize the database. You can initialize the database using a database authenticated user or a Windows-authenticated user.

**Note:** Before you proceed, verify that you have installed a DBMS, created the Mart database and run the initial queries. If the Mart is already initialized, the Login page appears.

When you open erwin Mart Administrator for the first time, the Initialize Mart web page appears.

**Follow these steps:**

1. If you are using MartServer as a Windows service, help ensure that the service is started. If not, from the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8(32-bit or 64-bit), Start Mart Server to start the Mart Server.
   
   A Windows command prompt window appears and indicates when the server starts.

2. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8(32-bit or 64-bit), erwin Mart Administrator r9.8(32-bit or 64-bit).

   erwin Mart Administrator opens in your default browser.

3. Complete the following fields:

   **Username**
   
   Defines the user name with which you want to access the Mart. If you are using a Windows-authenticated user, enter the name in the `<domain name>/<user name>` format.

   **Password**
   
   Defines the password for the user name.

   **Note:** A password should fulfill the following criteria:

   - Contains at least 1 lowercase character
   - Contains at least 1 uppercase character
   - Contains at least 1 number
   - Is minimum 6 characters in length
   - Is maximum 130 characters in length

   Apart from the above criteria, special characters are optional.
Confirm Password
Confirms the password that you entered in the previous field.

Email Address
Defines the email address for the user account that you are creating.

Mart Role
Defines the role of the user for the Mart.
Table Tablespace
Defines the table tablespace in which the Mart tables are created.

Index Tablespace
Defines the index tablespace in which the Mart indexes are created.

4. Click Initialize.

The user name is added as an administrator of Mart, Mart is initialized, and the Login web page appears. Initializing is a one-time task. After Mart is initialized, the user who initialized must log in first. Later, any other user who wants to use erwin Mart Administrator can log in.

Note: The user name that is entered here is an application level user and not a database user. Remember the password that you have entered here, because without the password you cannot log in to erwin Mart Administrator for the first time.

In the previous releases, only a server user was allowed to initialize a Mart. From release r9.6, a Windows-authenticated user can also initialize a Mart. Further, a Windows-authenticated user can log in to a Mart as a Windows user.

To initialize a Mart with a Windows-authenticated user, follow these steps:

1. Provide the Active Directory details with user credentials in the Active Directory Details section in the erwin Mart Configuration dialog.

2. Open erwin Mart Administrator, enter the user name in the <domain name>/<user name> format. For more information about how to initialize a Mart, see the Workgroup Edition Implementation and Administration Guide.

To log in as a Windows-authenticated user, follow these steps:

This procedure describes how to enable a Windows-authenticated user log in to a Mart that is already initialized. Use this procedure if the Mart is initialized with either a server user or a Windows-authenticated user.

1. Ensure that you have provided the Active Directory details with user credentials in the Active Directory Details section in the erwin Mart Configuration dialog.

2. Log in to the Mart as an administrator and add the required user as a Windows user in the Mart. Ensure that the user belongs to the Active Directory that was provided at the time of configuring the Mart.

Now the Windows-authenticated user can log in to erwin Mart Administrator by providing the user name in the <domain name>/<user name> format.

Note: A local Windows user who does not belong to a domain or who is not part of an Active Directory cannot log in to the Mart as a Windows user.
Log In to erwin Mart Administrator and Configure Settings

After the Mart is initialized, the user who initialized must log in first.

**Note:** If you enter an incorrect password five consecutive times, your account will be locked for five minutes (300 seconds) by default. You can change the time for which the account stays locked as follows:

1. From Windows Start menu, click All Programs, erwin, Mart Server r9.8(32-bit or 64-bit), Configure MartServer.
   
   The erwin Mart Configuration dialog appears.

2. On the Mart Administrator tab, edit the value of the Account Lockout Duration (Seconds) field to an appropriate value. At the most, you can set it to 30 days (2592000 seconds).

When you log in to Mart for the first time, configure it per the requirements of your organization. You can configure the following settings:

- Default profile for the model creator
- Use default password
- Email notification

**Follow these steps:**

1. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8(32-bit or 64-bit), erwin Mart Administrator r9.8(32-bit or 64-bit).
   
   The erwin Mart Administrator home page appears. If you have implemented SSL, HTTPS appears in the address bar.

2. Use the credentials with which you initialized the Mart and log in.

3. Click Settings.

4. Complete the following fields:

   **Default profile for model creator**

   Specifies the profile that is assigned to a user on a model. This profile is assigned whenever a user creates a model and saves it to Mart for the first time. The user inherits the permissions of the default profile selected here on the model that is saved. For example, suppose that User1 is assigned with Modeler profile and the System Administrator selects Architect as the default profile for model creator. If User1 creates Model1 and saves it to Mart, for Model1, User1 inherits the permissions of Architect. Now, suppose that the System Administrator selects Viewer as the default profile for model creator, and suppose that User1 creates Model2 and saves it to Mart. For Model2, User1 inherits the permissions of Viewer.

   **Use Default Password**
Specifies the default password that you want to use for new users and for resetting passwords, in the absence of an SMTP server for emails.

**Note:** Select this option only if you do not have an SMTP server that is configured for emails.

**SMTP host name**
- Specifies the name of the SMTP host. Enter the name in the mail.domain.com format. Notification emails are sent from this server.

**Port number**
- Specifies the port number of the SMTP server. The default port number is 25. If your company is using an alternate port number for the mail server, specify that port number.

**Authenticate**
- Specifies whether transactions with the SMTP server are authenticated. Select the check box to authenticate.

**User name**
- Specifies the user name to authenticate the SMTP server. Select the Authenticate check box to enable authentication.

**Password**
- Specifies the password to authenticate the SMTP server. Select the Authenticate check box to enable authentication.

**Administrator email**
- Specifies the email ID of the Mart administrator. Notifications to Mart users are sent from this ID.

**No-reply email from**
- Specifies the email ID from which administrative emails such as the password reset email are sent.

**Use TLS Connection**
- Specifies whether transactions with the SMTP server use a Transport layer Security (TLS). If you intend to use a TLS connection, ensure that the User name and Administrator email correspond to each other.

**Note:** Select this option only if you want to use a TLS connection.

5. Click Save.

Mart options are configured.

You have installed and configured erwin DM Mart.
Use a Pluggable Database

This information applies to Oracle 12c.

You can use the pluggable database concept of Oracle 12c and create multiple Marts of the same Mart release in a single Oracle instance. For example, you can create two pluggable databases erwin_test and erwin_production in an Oracle global database erwin. You can configure these databases with the Mart Server one after the other and connect to one of them at a time.

**Follow these steps to use multiple pluggable databases:**

1. Create multiple pluggable databases, for example, erwin_test and erwin_production.
2. Install erwin Mart Server for the first pluggable database, for example, erwin_test.
3. Initialize the Mart for the first pluggable database, erwin_test. For more information on how to initialize the Mart, see the Initialize an Oracle Mart topic.
4. Log in to the Mart and create the models that you want to store in the test Mart.
5. To use the second pluggable database, follow these steps:
   a. Stop the Mart server or the Mart server service.
   b. Repeat Steps 1, 2, and 3 for the second pluggable database, erwin_production.
   c. Start the Mart server or the Mart server service.
   d. Log in to the Mart and create the models as required.

Create a Pluggable Database

You can use the pluggable database concept in Oracle 12c and create multiple Marts of the same Mart release.

**Follow these steps:**

1. Create a pluggable database in Oracle 12c.
   For example, provide the Global Database Name as erwin and the Pluggable Database Name as erwin_test.
   **Note:** For more information on how to create a pluggable database, see the Oracle documentation.
2. Run the following script on the computer where Oracle 12c is installed:
   ```sql
   DROP TABLESPACE MMDATA INCLUDING CONTENTS AND DATAFILES CASCADE CONSTRAINTS;
   DROP TABLESPACE MMINDEX INCLUDING CONTENTS AND DATAFILES CASCADE CONSTRAINTS;
   DROP TABLESPACE marttemp INCLUDING CONTENTS AND DATAFILES CASCADE CONSTRAINTS;
   ```
ALTER SESSION SET CONTAINER=erwin_test;

CREATE TABLESPACE MMDATA datafile 'c:\r9mart2\MMDATA.dbf' size 300m autoextend on;

CREATE TABLESPACE MMINDEX datafile 'c:\r9mart2\MMINDEX.dbf' size 300m autoextend on;

CREATE TEMPORARY TABLESPACE marttemp tempfile 'c:\r9mart2\tempdata.dbf' size 300m autoextend on;
DROP USER MMADMIN CASCADE;

CREATE USER MMADMIN IDENTIFIED BY MMADMIN DEFAULT TABLESPACE MMDATA TEMPORARY TABLESPACE MARTTEMP QUOTA UNLIMITED ON MMDATA QUOTA UNLIMITED ON MMINDEX;

DROP ROLE MMINSTALL;
CREATE ROLE MMINSTALL;
GRANT CREATE SEQUENCE TO MMINSTALL;
GRANT CREATE TABLE TO MMINSTALL;
GRANT CREATE VIEW TO MMINSTALL;
GRANT DROP PUBLIC SYNONYM TO MMINSTALL;
GRANT CREATE PUBLIC SYNONYM TO MMINSTALL;
GRANT CREATE PROCEDURE TO MMINSTALL;
DROP ROLE MMUSER;
CREATE ROLE MMUSER;
GRANT CREATE SESSION TO MMUSER;
GRANT MMUSER TO MMINSTALL;
GRANT MMINSTALL TO MMADMIN;
GRANT DBA TO MMADMIN;
Install erwin Mart Server with a Pluggable Database

The procedure to install erwin Mart Server for a pluggable database is same as the procedure for a normal database. This topic describes only those fields that need different values for a pluggable database. For more information on how to configure the erwin Mart Server, see the Install erwin Mart Server topic.

The following fields on the Configure the erwin Mart Server dialog need different values:

**Server Name**
Specifies the name of the database server where you have installed the Mart database. Enter the name of the computer where Oracle 12c is installed and the pluggable database erwin_test is created.

**Database Name**
Specifies the name of the pluggable Mart database. For example, erwin_test.

**User Name**
Specifies the user name to connect to the Mart database. Enter mmadmin or any other user account that you have created when you ran the script.

**Password**
Specifies the password to connect to the Mart database. Enter mmadmin or any other password that you have created when you ran the script.

How to Upgrade any r9 Series Mart to the Current Version

If you are using any earlier release of r9 series and you want to upgrade it to the latest release, upgrade the Mart Server and the Mart database. The Mart server program is upgraded, so you must implement the upgraded software.

**Important!** The current Mart is designed to work with only the current version of erwin® Data Modeler. If you try to connect the current Mart with an older version erwin® Data Modeler such as r9.0.0, it may corrupt the Mart and cause unexpected behavior.
The following diagram illustrates how System Administrators can upgrade a Mart from any earlier release of r9 series to the latest release:

```
Complete the following tasks to upgrade a Mart of any earlier release of r9 series to the latest release:
1. Review the prerequisites.
2. Upgrade the Mart Server.
3. Configure the Mart Server.
4. Restart the Mart Server service.
5. Log In to erwin Web Admin.
```

**Review the Prerequisites**

Review the following prerequisites before you start the upgrade process:

If the Mart database is an Oracle database, the default tablespaces that were used for initializing the any earlier release of r9 series Mart are available for the latest release.
Upgrade the Mart Server

If you are upgrading a Mart from any earlier release of r9 series to the latest release, upgrade the Mart Server.

Note: See the Install a Mart or Upgrade a Mart topic before proceeding.

Follow these steps:

1. If you are running MartServer as a Windows service, stop the service and delete it.
   
   Note: If you upgrade the Mart Server without stopping the service, Mart Server may not start after you complete the upgrade process.

2. Download and run the EDMMS98(32-bit or 64-bit).exe file from the erwin Support site.
   
   The erwin Mart Server r9.8(32-bit or 64-bit) Install Shield Wizard dialog appears.

3. Follow the wizard.
   
   The Mart Server is upgraded.

4. Restart your computer.

Configure the Mart Server

To connect to the latest Mart, you must configure the Mart Server. Use the same database that you have used for the r9.0.0 Mart (or any earlier release of r9 series Mart).

Note: See the Upgrade Considerations topic before proceeding.
Follow these steps:

1. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8 (32-bit or 64-bit), Configure MartServer. The erwin Mart Configuration dialog appears.

Configure the erwin Mart Server

1. Complete the following fields in the Mart Server tab:

   **Database Type**
   - Specifies the database server type.

   **Port No.**
   - Specifies the port number of the database server.

   **Server Name**
   - Specifies the name of the database server where you have installed the Mart database. For example, suppose that you are using SQL Server as the Mart database. Enter the name of the computer where SQL Server is installed.

   **Instance Name**
   - Specifies the name of the database instance.

   **Database Name**
   - Specifies the name of the Mart database.

   **Note:** If you are installing the Mart for the first time, use a new database. Do not use an existing database that was created for r7.3 through r8.2.9 Mart. If you are upgrading the Mart from any earlier release of r9 series to the latest release, use the corresponding Mart database.

   **User Name**
   - Specifies the user name to connect to the Mart database. Enter the name of a user that is authenticated by the Mart database.

   **Note:** Windows authentication (User Name field) is not supported for connecting to the Mart database from the Configure Mart Server window.
Password

Specifies the password to connect to the Mart database.

Note: The following fields—Domain Controller Name, Domain/User Name, and Password are required only if you are using the Active Directory authentication. You can use the Active Directory authentication to initialize the Mart and to log in to erwin Mart Administrator.

Domain Controller Name

Specifies the fully qualified name of the Active Directory Server (Domain Controller). Enter the name in the following format:

LDAP://server/distinguished-name

Example: ldap://mktgna:3268/dc=abc, dc=com

Here, mktgna is the server name. You can provide either the name of the server or the IP address. 3268 is the port number to which the server listens. dc=abc, dc=com is the distinguished-name. The distinguished name is the full path of the object.

Note: If you do not know the Domain Controller Name, use the Nltest command or talk to your System Administrator.

Domain/User Name

Specifies the domain name and user name in the <domain name>/<user name> format.

Password

Specifies the password of the domain user.

Configure erwin Mart Administrator

1. Enter the following information in the Mart Administrator tab:

Server Name

Specifies the name of the computer where the Web Server is present. For example, if you are using Tomcat, enter the name of the computer where Tomcat is installed.

Default: localhost

Port Number

Specifies the port number on which the Web Server is running.

Default: 18170
Application Name

Specifies the application name with which the Web Server is identified.

Default: MartServer

Transport Layer Security

Specifies if you want to connect to the Mart through a secured connection (SSL). Select this check box if you have implemented SSL.

Hosting Server

Specifies that you want to use the IIS web server to connect to the Mart. Select this check box only if you have configured IIS.

IIS Port

Specify the IIS port number that you want to use. This field is enabled only if you select the Use IIS check box. The default is 80.

Account Lockout Duration (Seconds)

Specify the duration (in seconds) for which an account should be locked whenever an incorrect password is entered five consecutive times. By default, it is set to five minutes (300 seconds). At the most, you can set it to 30 days (2592000 seconds).

2. Click Configure.

The erwin Mart Administrator and the Mart Server are configured.

Restart the Mart Server Service

When you modify the details of the Mart Server and Mart Administration programs, restart the Mart Server service.

Follow these steps:

1. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8(32-bit or 64-bit), Stop MartServer Service to stop the Mart Server service.

2. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8(32-bit or 64-bit), Start MartServer Service to start the Mart Server service.
Log In to erwin Mart Administrator

Log in to erwin Mart Administrator to verify if you have successfully upgraded the Mart Server from any earlier release of r9 series to the latest release.

Follow these steps:

1. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8(32-bit or 64-bit), erwin Mart Administrator r9.8(32-bit or 64-bit).
   The erwin Mart Administrator log in page appears. If you have implemented SSL, HTTPS appears in the address bar.

2. Use the credentials with which you initialized the Mart and log in.
   The erwin Mart Administrator home page appears.

The models that are created in any earlier release of r9 series are upgraded when a user connects to the latest release Mart and opens the models.
Change the Mart Database Server

Sometimes, you may change the server on which the Mart database is installed, or you may restore the Mart database with a new name. When there is a change the server name or database name, reconfigure the MartServer.

**Follow these steps:**
1. Back up your Mart database.
2. Restore the database on the designated server.
3. If you use the same computer for Mart Server and restore the database in a different name, include the new database name in the erwin Mart Configuration dialog.
   
   From the Windows Start menu, open the erwin Mart Configuration dialog. In the Mart Server tab, Database Name field, enter the new name with which the database is restored. Enter the current user name and password to access the database. If wrong information is provided here, you may be able to install the Mart, but you cannot log in and cannot use it.
4. If you use a different computer for Mart Server and restore the database in the same name, install the Mart Server on the new computer.
   
   Use the Install erwin Mart Server procedure and install the Mart Server. In the Mart Server tab, Server Name field, enter the name of the new server where the database is restored. Enter the current user name and password to access the database. If wrong information is provided here, you may be able to install the Mart, but you cannot log in and cannot use it.
5. Stop the MartServer service and start it again.
6. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8(32-bit or 64-bit), erwin Mart Administrator r9.8(32-bit or 64-bit).
   
   Enter the credentials of the Mart administrator and log in.

**Troubleshooting**

This section explains the errors that you can encounter while installing and configuring Mart, and how you can troubleshoot them.

**Note:** The Mart Server log files are available in the following location:

Windows 7: {user.home}/AppData/Local/erwin Mart Server/logs/application.log
Unable to Create MartServer Service

Symptom:
If Mart Server is upgraded to the latest version without stopping and deleting the Mart Server service of the earlier version, creating a new Mart Server service does not work.

Solution:
Run the `sc Delete MartServer` command to delete the Mart Server Service from command prompt and then try to create a Mart Server Service in the new version.

Port out of range

Symptom:
Whenever I connect to the web server, I get the following error message:

```
java.lang.IllegalArgumentException: port out of range 80821.
```

Solution:
Type the correct port number in the Configure erwin Mart Administrator’s Server dialog and then restart your web server.

Call failed on the server

Symptom:
When I try to connect to the Mart server, I get the following error:

```
500 The call failed on the server; see server log for details
```

Solution:
The probable reasons for this error could be one of the following reasons:

- The server name is not correct.
- The application name is not correct. By default, the application name is MartServer and it is case-sensitive.

Type the correct server name and application name in the erwin Mart Administrator’s Server dialog and the Configure MartServer Details dialog. Restart the web server.
Troubleshooting

**Application Internal Error**

**Symptom:**
When I try to connect to the database, I get the following error:

*Application Internal Error*

**Solution**
You get this error when the MartServer application is unable to connect to the required database. The following reasons are probable for this error:

- The database details that are provided in the Configure MartServer Details dialog are incorrect.
- The username and the password for the database are incorrect.
- The database is not present.
- The port number for the database is incorrect.
- The network is down.

Ensure that you enter the correct details of your database in the Mart Server tab of the erwin Mart Configuration dialog.

**ORA-12514 TNS listener does not currently know of service requested in connect descriptor**

**Symptom:**
When I try to open the erwin Mart Administrator page, I get the Application Internal Error. The Tomcat windows shows the following error message:

*ORA-12514, TNS:listener does not currently know of service requested in connect descriptor*

**Solution:**
Use a fully qualified instance name when starting the Mart Server.

48  Workgroup Edition Implementation and Administration Guide
Mart already exists. Specify another database name

Symptom:
When I try to connect to the Mart, I get the following error message:

An earlier mart is already present in the database you are trying to initialize. This process cannot be continued. Please specify another database name to continue.

Solution:
You get this error when you connect to an old Mart that you have used for erwin DM Release r7 series, r8 series, or Beta release of any r9 series release.

Create a database and provide its details in the Configure MartServer Details dialog.

Initialize page is not loading in Internet Explorer

Symptom:
When I type the URL to initialize my Mart in Internet Explorer, the Initialize Mart page is taking a long time to load.

Solution:
The Initialize Mart page does not load because the Active Scripting option in Internet Explorer is disabled.

To enable Active Scripting, follow these steps:
1. In Internet Explorer, click Tools, Internet Options.
2. In the Security tab, click the Custom Level button.
   The Security Settings – Local Intranet Zone window opens.
3. From the list of options, locate Scripting, Active Scripting, and select Enable. Click OK.
4. Restart Internet Explorer and enter the URL to initialize Mart.
   The Mart Initialize page opens.
The Tomcat server is not starting properly. The Configure button is disabled.

**Symptom:**
My administrator has given me the Administrator rights and when I start the Tomcat server, I get a series of errors. Also, I cannot click the Configure button in the configuration dialog because it is disabled.

**Solution:**
Right-click Start Server, and click Run as Administrator.
The Tomcat server starts without any error, and the configuration button is enabled.

A connection with the server could not be established

**Symptom:**
When I try to connect to the web server from erwin Data Modeler, I get the following error message:
A connection with the server could not be established

**Solution:**
Verify that you have provided the correct port number and then reconnect to the web server.

The server name or address could not be resolved

**Symptom:**
When I try to connect to the web server from erwin Data Modeler, I get the following error message:
The server name or address could not be resolved

**Solution:**
Verify that the server name where the web server is installed is correct and then reconnect to the server.

**Note:** If erwin Data Modeler and the web server are installed on the same computer, you can give the server name as localhost. Suppose that erwin® Data Modeler and the web server are installed on different computers. The server name is the name of the computer where the web server is installed.
Invalid user ID or password

**Symptom:**
When I try to connect to the server, I get the following error message:

Invalid user ID or password. Please try again to login.

**Solution:**
Type the correct user name and password.

**Note:** The user must be an application level user and not a database user.

Error 12029

**Symptom:**
When I connect to the web server, I get the following error message:

Error 12029

**Solution:**
Restart the web server.

Unable to load the web page from my web browser

**Symptom:**
When I type the URL in Internet Explorer or Google Chrome to connect to the web server, I get the following error messages:

**For Internet Explorer**

Internet Explorer cannot display the webpage

**For Google Chrome**

Oops! Google Chrome could not connect to localhost:18170

**Solution:**
Restart the web server.
Internet Explorer Redirects to a Different Link

**Symptom:**
Suppose that I install erwin Mart Server on a fresh machine. If I enable the SSL option and I invoke erwin Mart Administrator, Internet Explorer redirects the page to res://ieframe.dll/.

**Solution:**
Internet Explorer versions 8 through 10 have a security enhancement that blocks the following types of sites:
- Sites that have self-signed certificates
- Sites that have self-signed certificates where the certificate does not match the URL

**Follow any of these steps:**
- Install the certificate in the Trusted Root Certification Authorities store.
- Add the site to trusted sites.
- Set the Internet Explorer Security level to Medium Low.
I have a very long Windows user name and I cannot log in to the Mart through erwin Data Modeler

**Symptom:**
I have added a very long Windows user name similar to "Magdalena.Chalamalasetti" using the Mart Administrator. When the user tries to log in to the Mart through erwin® Data Modeler, the name is truncated to "US\Magdalena.Chalamas" and the user cannot log in.

**Solution:**
The name is truncated due to a limitation with Windows. The Windows API returns the legacy user name that is limited to 20 characters. If the length of a user name exceeds 20 characters, for example, "US\Magdalena.Chalamalasetti", the name is displayed as "US\Magdalena.Chalamas" in the Connect to Mart dialog.

You can resolve this in one of the following ways:

- Type the first 20 characters of the user name when you add the user as a Windows User, in the Mart Administrator. For example, instead of typing "US\Magdalena.Chalamalasetti", type "US\Magdalena.Chalamalas".

- Use a Windows Group instead of the user’s domain name. Using your Windows domain controller software, add the user to a Windows Group, and then add the group as a User Group in the Mart Administrator. For more information about how to add a User Group, see [erwin Data Modeler r9 Workgroup Edition: Support for Directory Services](#) video.

**SSL Certificate Error**

**Symptom:**
When you open Mart Administrator from Mart Server that is configured with an SSL certification, an SSL certificate error appears.

**Solution:**
1. Replace localhost in the Mart Server URL with your computer name.
   - https://localhost:12345/MartAdmin/
   - https://<computer_name>:12345/MartAdmin/
2. Use the updated URL to access the Mart Server.
Unable to save a model to Mart with an existing model name

**Symptom:**

When you save a model to Mart with an existing model name, a dialog with the following text appears.

Model '<model name>' already exists in library '<mart name>'. Rename the new model name

**Solution:**

Save the model with a different name.
Chapter 3: Install and Configure a PostgreSQL Mart

This section describes how you can install and configure a Mart on a PostgreSQL database.

This section contains the following topics

How to Install and Configure a PostgreSQL Mart (see page 56)
How to Install and Configure a PostgreSQL Mart

In the previous versions, erwin® Data Modeler connected to the Mart server directly. Now, erwin® Data Modeler connects to the Mart server through a web server.

The Mart comprises the following components:

Database
Stores the user data for the Workgroup Edition. You can use PostgreSQL through version 9.6.2 or the certified version 9.6.5 database for the Mart database.

Applications
Includes a web-based component named erwin Mart Administrator that helps you manage the Mart through a web console.

Web server
Hosts erwin Mart Administrator. You can use a web server of your choice. If you have not installed a web server, use the erwin Mart Server option and install Tomcat.

If you are using the Workgroup Edition, you must install and configure erwin Mart Administrator.

The following diagram illustrates how to install and configure a Mart:
Complete the following steps in the same order to install and configure the Mart:

1. Review the Prerequisites for a PostgreSQL Mart
2. Create a PostgreSQL Database. (see page 63)
3. Install erwin Mart Server.
4. Use MartServer as a Windows Service.
5. Initialize a PostgreSQL Mart.
Mart Architecture

In the previous versions, erwin DM connected to the Mart database through the database client software. Now, the application connects to the Mart database through a web server. The database client software is no longer required. The web server includes a web-based administration console—erwin Mart Administrator. If you are using the Workgroup Edition, you must install and configure erwin Mart Administrator.

Database
Stores the user data for the Workgroup Edition. You can use a PostgreSQL through version 9.6.2 or the certified version 9.6.5 database for the Mart database. You must use a new database and not an existing database that was created for an older version of the data modeling tool.

Applications
Includes a web-based component named erwin Mart Administrator that helps you manage the Mart through a web console.

Web server
Hosts erwin Mart Administrator. You can use a web server of your choice. If you have not installed a web server, use the erwin Mart Server option and install Tomcat.

The following diagram shows the new architecture:
The new architecture has the following benefits:

- **Separate logical and physical users:** In the previous versions, Mart (or Model Manager) users required database level privileges to access the Mart functionality. The Mart database administrators added or deleted users in the Mart database. This approach is changed now. The logical users are separated from physical users, so Mart Administrators can create the Mart users without creating the corresponding database users.

- **Authentication through Active Directory services:** Earlier, if you wanted to provide access to a user group, you added each user individually. Now, because of the new architecture, you can use the Active Directory services and can provide access to the group. Anyone who is part of the group gets access.

- **Mart administration outside erwin® Data Modeler:** In the previous versions, Mart Administrators used erwin® Data Modeler for administrative activities such as managing permissions. This required non-modelers to know how to use erwin® Data Modeler. In the new architecture, the administration component is built on a separate layer on top of erwin® Data Modeler and is hosted on a web server. Mart Administrators can access erwin Web Admin from any computer and can perform administrative activities through a web console.

### Install a Mart

Use the following guidelines to determine if you must install a Mart or upgrade a Mart:

If you are new to erwin® Data Modeler and have purchased the current version of Workgroup Edition, then install the current version of the Mart. Use the How to Install and Configure a Mart procedure that is appropriate for your Mart database.

**Note:** If you have an existing Mart and the version is r7.3 through r8.2.9, install the current version Mart. Use the How to Install and Configure a Mart procedure that is appropriate for your Mart database. After installing the Mart, use the Upgrade Mart utility to upgrade the Mart models from r7.3 through r8.2.9 to the current version.
Review the Prerequisites for a PostgreSQL Mart

Before you install the Mart components, help ensure that the minimum system requirements that are outlined in this topic are met.

You can use any of the following combinations to install erwin® Data Modeler, the Mart database, and the MartServer application:

■ Install erwin Data Modeler, the Mart database, and the MartServer application on the same computer.
■ Install erwin Data Modeler, the Mart database, and the MartServer application on different computers.
■ Install erwin Data Modeler and the Mart database on one computer, and install the MartServer application on a different computer.
■ Install erwin Data Modeler on one computer, and install the Mart database and the MartServer application on a different computer.

Ensure that you always install the MartServer application on Windows operating system.

System requirements to install the MartServer application

Hardware requirements (based on physical hardware performance, not a virtual environment):

Hardware requirements (based on physical hardware performance, not a virtual environment):

■ 2 GHZ or higher dual core processor
■ 4 GB RAM (8 GB or more for large marts)
■ 4 GB of disk space or more as required to support your specific mart
Operating system:
- Microsoft Windows Server 2008 SP2, R2
- Microsoft Windows 7 SP1
- Microsoft Windows 8.1
- Microsoft Windows 10
- Microsoft Windows Server 2012, R2
- Microsoft Windows Server 2016
- Microsoft .NET Framework 3.5 and above
- All current Microsoft Windows critical updates are applied

Database:
- The Mart Server can use a standalone or can share an existing database server for PostgreSQL through Release 9.6.2 database. Also, it is certified on PostgreSQL Release 9.6.5.
- The database user account that is used to configure the Mart must have super user permissions.

erwin Mart Administrator web client:

Supported browsers:
- Microsoft Internet Explorer v10® or newer
- Mozilla Firefox® v30 or newer
- Google Chrome v30 or newer
- Apple Safari 6 or newer

Other requirements

Help ensure that the following additional requirements are met:
- If you want to use Microsoft IIS as the web server, you have configured it.
- The DBMS is installed and prepared for creating the Mart Database.
- The Mart database is created. At least one user with administrator privileges is present.
- If you want to add Windows Group users as Mart users, you have the Active Directory Server details.

**Note:** You can add Windows Group users as normal Mart users, but not as Mart administrators. A Mart administrator must be a server or Windows user.
Important disclaimer notice on all requirements

1. The requirements that are mentioned previously define the minimum requirements which permit the application to run with reasonable performance based on a small business use case scenario. The actual requirements for an enterprise-wide use case based on larger models and configurations require significantly greater resources to obtain acceptable performance.

2. These requirements are based on actual physical hardware (no virtual environment) and the following assumptions:
   - Minimal to no network overhead (both the database and application servers are locally installed)
   - Vendor’s default install of the current version of their software (with all current service or fix packs)
   - No other applications sharing the defined hardware configuration (for example, a “clean” machine)

Any other hardware/software configurations are acceptable as long as they provide the same (or better) performance characteristics identified.
Create a PostgreSQL Database

If you are a DBA or a system administrator responsible for installing the software on a PostgreSQL database management system, perform the following tasks:

Use a graphical user interface (GUI) tool, pgAdmin III, to create the erwin Data Modeler Workgroup Edition database. If a GUI tool is not available, you can use SQL Shell to type in the appropriate commands manually.

Configure PostgreSQL:

You can configure PostgreSQL database to accept any IP address.

Follow these steps:
1. Set the IP address to 0.0.0.0/0
2. Select the server.
3. Click Tools, Server Configuration, pg_hba.conf. This file is available in the Data folder in the Install directory.
4. Double-click the last empty column.
5. Complete the following fields:
   - **Type**: host
   - **Database**: all
   - **Ip_Address**: 0.0.0.0/0
   - **Method**: md5
6. Select Enable and click Ok.
7. Click Save.
8. Click Reload Server.

The PostgreSQL database configuration is complete.
Install erwin Mart Server

The Mart Server and Mart Admin war files are deployed on a Web server. You can either use an existing web server, or install the web server through the erwin MartServer r9.8 Installation Wizard. You must install erwin Mart Server and configure it regardless of whether you use Mart Server as a Windows service.

Note: Ensure that you have reviewed the Install a Mart or Upgrade a Mart topic before proceeding.

Follow these steps:
1. Do one of the following tasks:
   - Insert the installation DVD and select Mart Server Installation.
   - Download the EDMMS98 (32-bit or 64-bit).exe file from the online erwin product page and run it.
   The erwin MartServer r9.8(32-bit or 64-bit) Installation Wizard appears.
2. Go through the wizard steps to install erwin Mart Server.
   Depending on the options you select, erwin Mart Server and/or Java Runtime Environment (JRE) and Tomcat are installed.
   Note: If Java (any version) is already available in the computer and the environment variable JRE_HOME is set, the installer overwrites JRE_HOME with the new Java path. The JRE version that is shipped with the installer is 1.8.
3. From the Windows Start menu, click All Programs, erwin, Mart Server r9.8(32-bit or 64-bit), Configure MartServer.
   The erwin Mart Configuration dialog appears.

Configure the erwin Mart Server
1. Complete the following fields in the Mart Server tab:
   Database Type
   Specifies the database server type.
   Port No.
   Specifies the port number of the database server.
   Server Name
   Specifies the name of the database server where you have installed the Mart database. For example, suppose that you are using SQL Server as the Mart database. Enter the name of the computer where SQL Server is installed.
Instance Name

Specifies the name of the database instance.

Database Name

Specifies the name of the Mart database.

Note: If you are installing the Mart for the first time, use a new database. Do not use an existing database that was created for r7.3 through r8.2.9 Mart. If you are upgrading the Mart from any earlier release of r9 series to the latest release, use the corresponding Mart database.

User Name

Specifies the user name to connect to the Mart database. Enter the name of a user that is authenticated by the Mart database.

Note: Windows authentication (User Name field) is not supported for connecting to the Mart database from the Configure Mart Server window.

Password

Specifies the password to connect to the Mart database.

Note: The following fields—Domain Controller Name, Domain/User Name, and Password are required only if you are using the Active Directory authentication. You can use the Active Directory authentication to initialize the Mart and to log in to erwin Mart Administrator.

Domain Controller Name

Specifies the fully qualified name of the Active Directory Server (Domain Controller). Enter the name in the following format:

LDAP://server/distinguished-name

Example: ldap://mktgna:3268/dc=abc, dc=com

Here, mktgna is the server name. You can provide either the name of the server or the IP address. 3268 is the port number to which the server listens. 

dc=abc, dc=com is the distinguished-name. The distinguished name is the full path of the object.

Note: If you do not know the Domain Controller Name, use the Nltest command or talk to your System Administrator.

Domain/User Name

Specifies the domain name and user name in the <domain name>/<user name> format.

Password

Specifies the password of the domain user.
Configure erwin Mart Administrator

1. Enter the following information in the Mart Administrator tab:

   **Server Name**
   Specifies the name of the computer where the Web Server is present. For example, if you are using Tomcat, enter the name of the computer where Tomcat is installed.
   
   **Default:** localhost

   **Port Number**
   Specifies the port number on which the Web Server is running.
   
   **Default:** 18170

   **Application Name**
   Specifies the application name with which the Web Server is identified.
   
   **Default:** MartServer

   **Transport Layer Security**
   Specifies if you want to connect to the Mart through a secured connection (SSL). Select this check box if you have implemented SSL.

   **Hosting Server**
   Specifies that you want to use the IIS web server to connect to the Mart. Select this check box only if you have configured IIS.

   **IIS Port**
   Specify the IIS port number that you want to use. This field is enabled only if you select the Use IIS check box. The default is 80.

   **Account Lockout Duration (Seconds)**
   Specify the duration (in seconds) for which an account should be locked whenever an incorrect password is entered five consecutive times. By default, it is set to five minutes (300 seconds). At the most, you can set it to 30 days (2592000 seconds).

2. Click Configure.

   The erwin Mart Administrator and the Mart Server are configured.

More information:

- Configure IIS Web Server (see page 150)
- Implement SSL for IIS (see page 152)
Enable SSL for Tomcat

SSL enables you to access the Mart through a secured connection. You can enable SSL for Tomcat—the default web server, when you are installing the Mart for the first time.

Follow these steps:

1. If the Mart Server service is running, stop it. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8 (32-bit or 64-bit), Stop MartServer Service to stop the web server.

2. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8 (32-bit or 64-bit), Enable SSL for Tomcat Webserver.

   SSL is enabled for Tomcat and a security certificate is created. You must install this security certificate on all the computers from where you want to access the Mart.

3. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8 (32-bit or 64-bit), Configure MartServer.

   The erwin Mart Configuration dialog appears.

4. Go to the Mart Administrator tab and select the Transport Layer Security check box.

5. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8 (32-bit or 64-bit), Start Mart Server Service.

6. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8 (32-bit or 64-bit), erwin Mart Administrator r9.8 (32-bit or 64-bit).

   The erwin Mart Administrator home page appears and displays HTTPS in the address bar. If a certificate error appears, click Proceed Anyway to begin the session.

Important! If you want to connect to an SSL enabled Mart through API or the Mart Upgrade utility, you must first install the security certificate on the corresponding computer. Install the certificate through the data modeling tool. If you do not install the security certificate, the Mart Upgrade utility and the API will not be able to connect to the SSL enabled Mart.

Disable SSL and Access the Mart Through a Normal Connection

You can disable SSL at any time and access the Mart through a normal connection.

Follow these steps:

1. If the Mart Server Service is running, stop it. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8(32-bit or 64-bit), Stop Mart Server Service.

2. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8(32-bit or 64-bit), Disable SSL.

3. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8(32-bit or 64-bit), Configure MartServer.
The erwin Mart Configuration dialog appears.

4. Go to the Mart Administrator tab and clear the Transport Layer Security check box.

5. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8 (32-bit or 64-bit), Start Mart Server Service.

6. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8 (32-bit or 64-bit), erwin Mart Administrator r9.8 (32-bit or 64-bit).

   The erwin Mart Administrator home page appears and displays HTTP in the address bar.

**Use Mart Server as a Windows Service**

The current version of the Mart provides two ways to start the web server that hosts Mart Server:

- Start the web server manually.
- Use a Windows service to start the web server.

For example, if you have used Tomcat as the web server to host Mart Server, you can start Tomcat in two ways:

- Start Tomcat through the startup.bat file or through a shortcut to this file.
- Use a Windows service to start Tomcat.

The benefits of using a Windows service to start a web server are as follows:

- Any user with administrative privileges on a computer can start the Windows service, whereas, only designated users can start a web server manually.
- A Windows service runs regardless of whether a user has logged in. A manually-started web server shuts down when the user who started it logs out.

**Follow these steps:**

1. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8(32-bit or 64-bit), Create MartServer Service to create the MartServer Windows service.

   Creating the service is a one-time task. After the service is created, you only have to start and stop the service.

2. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8(32-bit or 64-bit), Start MartServer Service to start the web server.
Initialize a PostgreSQL Mart

When you access the Mart database through erwin Mart Administrator for the first time, you must initialize the database. You can initialize the database using a database authenticated user or a Windows authenticated user.

**Note:** Before you proceed, verify that you have installed a DBMS, created the Mart database and run the initial queries. If the Mart is already initialized, the Login page appears.

**Follow these steps:**

1. If you are using MartServer as a Windows service, help ensure that the service is started. If not, from the Windows Start menu, click All Programs, erwin, Mart Server r9.8(32-bit or 64-bit), Start Mart Server to start the Mart Server.

   A Windows command prompt window appears and indicates when the server starts.

2. From the Windows Start menu, click All Programs, erwin, Mart Server r9.8(32-bit or 64-bit), erwin Mart Administrator r9.8(32-bit or 64-bit).

   erwin Mart Administrator opens in your default browser.

3. Complete the following fields:

   **Username**
   
   Defines the user name with which you want to access the Mart. If you are using a Windows-authenticated user, enter the name in the `<domain name>/<user name>` format.

   **Password**
   
   Defines the password for the user name.
   
   **Note:** A password should fulfill the following criteria:
   
   - Contains at least 1 lowercase character
   - Contains at least 1 uppercase character
   - Contains at least 1 number
   - Is minimum 6 characters in length
   - Is maximum 130 characters in length
   
   Apart from the above criteria, special characters are optional.
Confirm Password

Confirms the password that you entered in the previous field.

Email Address

Defines the email address for the user account that you are creating.

4. Click Initialize.

The user name is added as an administrator of Mart, Mart is initialized, and the Login web page appears. Initializing is a one-time task. After Mart is initialized, the user who initialized must log in first. Later, any other user who wants to use erwin Mart Administrator can log in.

**Note:** The user name that is entered here is an application level user and not a database user. Remember the password that you have entered here, because without the password you cannot log in to erwin Mart Administrator for the first time.

In the previous releases, only a server user was allowed to initialize a Mart. From release r9.6, a Windows-authenticated user can also initialize a Mart. Further, a Windows-authenticated user can log in to a Mart as a Windows user.

**To initialize a Mart with a Windows-authenticated user, follow these steps:**

1. Provide the Active Directory details with user credentials in the Active Directory Details section in the erwin Mart Configuration dialog.

2. Open erwin Mart Administrator, enter the user name in the <domain name>/<user name> format. For more information about how to initialize a Mart, see the Workgroup Edition Implementation and Administration Guide.

**To log in as a Windows-authenticated user, follow these steps:**

This procedure describes how to enable a Windows-authenticated user log in to a Mart that is already initialized. Use this procedure if the Mart is initialized with either a server user or a Windows-authenticated user.

1. Ensure that you have provided the Active Directory details with user credentials in the Active Directory Details section in the erwin Mart Configuration dialog.

2. Log in to the Mart as an administrator and add the required user as a Windows user in the Mart. Ensure that the user belongs to the Active Directory that was provided at the time of configuring the Mart.

   Now the Windows-authenticated user can log in to erwin Mart Administrator by providing the user name in the <domain name>/<user name> format.

**Note:** A local Windows user who does not belong to a domain or who is not part of an Active Directory cannot log in to the Mart as a Windows user.
Log In to erwin Mart Administrator and Configure Settings

After the Mart is initialized, the user who initialized must log in first.

**Note:** If you enter an incorrect password five consecutive times, your account will be locked for five minutes (300 seconds) by default. You can change the time for which the account stays locked as follows:

1. From Windows Start menu, click All Programs, erwin, Mart Server r9.8(32-bit or 64-bit), Configure MartServer.
   
   The erwin Mart Configuration dialog appears.

2. On the Mart Administrator tab, edit the value of the Account Lockout Duration (Seconds) field to an appropriate value. At the most, you can set it to 30 days (2592000 seconds).

When you log in to Mart for the first time, configure it per the requirements of your organization. You can configure the following settings:

- Default profile for the model creator
- Use default password
- Email notification

**Follow these steps:**

1. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8(32-bit or 64-bit), erwin Mart Administrator r9.8(32-bit or 64-bit).
   
   The erwin Mart Administrator home page appears. If you have implemented SSL, HTTPS appears in the address bar.

2. Use the credentials with which you initialized the Mart and log in.

3. Click Settings.

4. Complete the following fields:

   **Default profile for model creator**

   Specifies the profile that is assigned to a user on a model. This profile is assigned whenever a user creates a model and saves it to Mart for the first time. The user inherits the permissions of the default profile selected here on the model that is saved. For example, suppose that User1 is assigned with Modeler profile and the System Administrator selects Architect as the default profile for model creator. If User1 creates Model1 and saves it to Mart, for Model1, User1 inherits the permissions of Architect. Now, suppose that the System Administrator selects Viewer as the default profile for model creator, and suppose that User1 creates Model2 and saves it to Mart. For Model2, User1 inherits the permissions of Viewer.

   **Use Default Password**
Specifies the default password that you want to use for new users and for resetting passwords, in the absence of an SMTP server for emails.

**Note:** Select this option only if you do not have an SMTP server that is configured for emails.

**SMTP host name**
Specifies the name of the SMTP host. Enter the name in the mail.domain.com format. Notification emails are sent from this server.

**Port number**
Specifies the port number of the SMTP server. The default port number is 25. If your company is using an alternate port number for the mail server, specify that port number.

**Authenticate**
Specifies whether transactions with the SMTP server are authenticated. Select the check box to authenticate.

**User name**
Specifies the user name to authenticate the SMTP server. Select the Authenticate check box to enable authentication.

**Password**
Specifies the password to authenticate the SMTP server. Select the Authenticate check box to enable authentication.

**Administrator email**
Specifies the email ID of the Mart administrator. Notifications to Mart users are sent from this ID.

**No-reply email from**
Specifies the email ID from which administrative emails such as the password reset email are sent.

**Use TLS Connection**
Specifies whether transactions with the SMTP server use a Transport layer Security (TLS). If you intend to use a TLS connection, ensure that the User name and Administrator email correspond to each other.

**Note:** Select this option only if you want to use a TLS connection.

5. Click Save.

Mart options are configured.

You have installed and configured erwin DM Mart.
Change the Mart Database Server

Sometimes, you may change the server on which the Mart database is installed, or you may restore the Mart database with a new name. When there is a change the server name or database name, reconfigure the MartServer.

**Follow these steps:**

1. Back up your Mart database.
2. Restore the database on the designated server.
3. If you use the same computer for Mart Server and restore the database in a different name, include the new database name in the erwin Mart Configuration dialog.

   From the Windows Start menu, open the erwin Mart Configuration dialog. In the Mart Server tab, Database Name field, enter the new name with which the database is restored. Enter the current user name and password to access the database. If wrong information is provided here, you may be able to install the Mart, but you cannot log in and cannot use it.

4. If you use a different computer for Mart Server and restore the database in the same name, install the Mart Server on the new computer.

   Use the Install erwin Mart Server procedure and install the Mart Server. In the Mart Server tab, Server Name field, enter the name of the new server where the database is restored. Enter the current user name and password to access the database. If wrong information is provided here, you may be able to install the Mart, but you cannot log in and cannot use it.

5. Stop the MartServer service and start it again.

6. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8 (32-bit or 64-bit), erwin Mart Administrator r9.8 (32-bit or 64-bit).

   Enter the credentials of the Mart administrator and log in.

**Troubleshooting**

This section explains the errors that you can encounter while installing and configuring Mart, and how you can troubleshoot them.

**Note:** The Mart Server log files are available in the following location:

Windows 7: {user.home}/AppData/Local/erwin Mart Server/logs/application.log
Unable to Create MartServer Service

**Symptom:**
If Mart Server is upgraded to the latest version without stopping and deleting the Mart Server service of the earlier version, creating a new Mart Server service does not work.

**Solution:**
Run the `sc Delete MartServer` command to delete the Mart Server Service from command prompt and then try to create a Mart Server Service in the new version.

Port out of range

**Symptom:**
Whenever I connect to the web server, I get the following error message:

```
java.lang.IllegalArgumentException: port out of range 80821.
```

**Solution:**
Type the correct port number in the Configure erwin Mart Administrator's Server dialog and then restart your web server.

Call failed on the server

**Symptom:**
When I try to connect to the Mart server, I get the following error:

```
500 The call failed on the server; see server log for details
```

**Solution:**
The probable reasons for this error could be one of the following reasons:

- The server name is not correct.
- The application name is not correct. By default, the application name is MartServer and it is case-sensitive.

Type the correct server name and application name in the erwin Mart Administrator's Server dialog and the Configure Mart Server Details dialog. Restart the web server.
Application Internal Error

Symptom:
When I try to connect to the database, I get the following error:

Application Internal Error

Solution
You get this error when the MartServer application is unable to connect to the required database. The following reasons are probable for this error:

- The database details that are provided in the Configure MartServer Details dialog are incorrect.
- The username and the password for the database are incorrect.
- The database is not present.
- The port number for the database is incorrect.
- The network is down.

Ensure that you enter the correct details of your database in the Mart Server tab of the erwin Mart Configuration dialog.

Mart already exists. Specify another database name

Symptom:
When I try to connect to the Mart, I get the following error message:

An earlier mart is already present in the database you are trying to initialize. This process cannot be continued. Please specify another database name to continue.

Solution:
You get this error when you connect to an old Mart that you have used for erwin DM Release r7 series, r8 series, or Beta release of any r9 series release.

Create a database and provide its details in the Configure MartServer Details dialog.
Initialize page is not loading in Internet Explorer

**Symptom:**
When I type the URL to initialize my Mart in Internet Explorer, the Initialize Mart page is taking a long time to load.

**Solution:**
The Initialize Mart page does not load because the Active Scripting option in Internet Explorer is disabled.

**To enable Active Scripting, follow these steps:**
1. In Internet Explorer, click Tools, Internet Options.
2. In the Security tab, click the Custom Level button.
   The Security Settings – Local Intranet Zone window opens.
3. From the list of options, locate Scripting, Active Scripting, and select Enable. Click OK.
4. Restart Internet Explorer and enter the URL to initialize Mart.
   The Mart Initialize page opens.

The Tomcat server is not starting properly. The Configure button is disabled.

**Symptom:**
My administrator has given me the Administrator rights and when I start the Tomcat server, I get a series of errors. Also, I cannot click the Configure button in the configuration dialog because it is disabled.

**Solution:**
Right-click Start Server, and click Run as Administrator.
The Tomcat server starts without any error, and the configuration button is enabled.

A connection with the server could not be established

**Symptom:**
When I try to connect to the web server from erwin Data Modeler, I get the following error message:

*A connection with the server could not be established*

**Solution:**
Verify that you have provided the correct port number and then reconnect to the web server.
The server name or address could not be resolved

**Symptom:**
When I try to connect to the web server from erwin Data Modeler, I get the following error message:

The server name or address could not be resolved

**Solution:**
Verify that the server name where the web server is installed is correct and then reconnect to the server.

**Note:** If erwin Data Modeler and the web server are installed on the same computer, you can give the server name as localhost. Suppose that erwin® Data Modeler and the web server are installed on different computers. The server name is the name of the computer where the web server is installed.

Invalid user ID or password

**Symptom:**
When I try to connect to the server, I get the following error message:

Invalid user ID or password. Please try again to login.

**Solution:**
Type the correct user name and password.

**Note:** The user must be an application level user and not a database user.

Error 12029

**Symptom:**
When I connect to the web server, I get the following error message:

Error 12029

**Solution:**
Restart the web server.
Unable to load the web page from my web browser

Symptom:
When I type the URL in Internet Explorer or Google Chrome to connect to the web server, I get the following error messages:

For Internet Explorer
Internet Explorer cannot display the webpage

For Google Chrome
Oops! Google Chrome could not connect to localhost:18170

Solution:
Restart the web server.

Internet Explorer Redirects to a Different Link

Symptom:
Suppose that I install erwin Mart Server on a fresh machine. If I enable the SSL option and I invoke erwin Mart Administrator, Internet Explorer redirects the page to res://ieframe.dll//.

Solution:
Internet Explorer versions 8 through 10 have a security enhancement that blocks the following types of sites:
- Sites that have self-signed certificates
- Sites that have self-signed certificates where the certificate does not match the URL

Follow any of these steps:
- Install the certificate in the Trusted Root Certification Authorities store.
- Add the site to trusted sites.
- Set the Internet Explorer Security level to Medium Low.

Chinese characters are replaced with question marks

Symptom:
I type Chinese characters in the Version Description dialog in erwin Mart Administrator. If I open erwin® Data Modeler and go to the Catalog Manager window, I see that the Chinese characters are replaced with ?????.
Solution:

Follow these steps:

1. Select Chinese for the Format, Location, and Locale fields in the computer where you have installed erwin® Data Modeler, Mart server, and Mart database. (You can access these settings through the Control Panel.)

2. Open the Database Properties dialog for the Mart database and verify the value for the Collation field.

3. If the value is other than SQL_Latin1_General_CP1_CI_AS, create a database and assign this value for Collation. Initialize the Mart again.

I have a very long Windows user name and I cannot log in to the Mart through erwin Data Modeler

Symptom:

I have added a very long Windows user name similar to "Magdalena.Chalamalasetti" using the Mart Administrator. When the user tries to log in to the Mart through erwin® Data Modeler, the name is truncated to "US\Magdalena.Chalamas" and the user cannot log in.

Solution:

The name is truncated due to a limitation with Windows. The Windows API returns the legacy user name that is limited to 20 characters. If the length of a user name exceeds 20 characters, for example, "US\Magdalena.Chalamalasetti", the name is displayed as "US\Magdalena.Chalamas" in the Connect to Mart dialog.

You can resolve this in one of the following ways:

- Type the first 20 characters of the user name when you add the user as a Windows User, in the Mart Administrator. For example, instead of typing "US\Magdalena.Chalamalasetti", type "US\Magdalena.Chalamalas".

- Use a Windows Group instead of the user's domain name. Using your Windows domain controller software, add the user to a Windows Group, and then add the group as a User Group in the Mart Administrator. For more information about how to add a User Group, see erwin Data Modeler r9 Workgroup Edition: Support for Directory Services video.
SSL Certificate Error

Symptom:
When you open Mart Administrator from Mart Server that is configured with an SSL certification, an SSL certificate error appears.

Solution:
1. Replace localhost in the Mart Server URL with your computer name.
   https://localhost:12345/MartAdmin/
   https://<computer_name>:12345/MartAdmin/
2. Use the updated URL to access the Mart Server

Unable to save a model to Mart with an existing model name

Symptom:
When you save a model to Mart with an existing model name, a dialog with the following text appears.

Model '<model name>' already exists in library '<mart name>'. Rename the new model name

Solution:
Save the model with a different name.
This section describes how you can install and configure a Mart on a SQL Server database.

This section contains the following topics:

- How to Install and Configure a SQL Server Mart (see page 82)
- How to Upgrade any r9 Series Mart to the Current Version (see page 100)
- Change the Mart Database Server (see page 106)
- Troubleshooting (see page 106)
How to Install and Configure a SQL Server Mart

In the previous versions, erwin® Data Modeler connected to the Mart server directly. Now, erwin® Data Modeler connects to the Mart server through a web server.

The Mart comprises the following components:

**Database**
Stores the user data for the Workgroup Edition. You can use a Microsoft SQL Server 2012, 2014, 2014 SP1, 2016 or 2016 SP1 database for the Mart database. You must use a new database and not an existing database that was created for an older version of the data modeling tool.

**Applications**
Includes a web-based component named erwin Mart Administrator that helps you manage the Mart through a web console.

**Web server**
Hosts erwin Mart Administrator. You can use a web server of your choice. If you have not installed a web server, use the erwin Mart Server option and install Tomcat.

If you are using the Workgroup Edition, you must install and configure erwin Mart Administrator.

The following diagram illustrates how to install and configure a Mart:
Complete the following steps in the same order to install and configure the Mart:

1. Review the Prerequisites for an SQL Server Mart.
2. Create an SQL Server Database. (see page 89)
3. Install erwin Mart Server.
4. Use MartServer as a Windows Service.
5. Initialize a SQL Server Mart.
**Mart Architecture**

In the previous versions, erwin DM connected to the Mart database through the database client software. Now, the application connects to the Mart database through a web server. The database client software is no longer required. The web server includes a web-based administration console—erwin Mart Administrator. If you are using the Workgroup Edition, you must install and configure erwin Mart Administrator.

**Database**

Stores the user data for the Workgroup Edition. You can use a Microsoft SQL Server 2012, 2014, 2014 SP1, 2016, or 2016 SP1 database for the Mart database. You must use a new database and not an existing database that was created for an older version of the data modeling tool.

**Applications**

Includes a web-based component named erwin Mart Administrator that helps you manage the Mart through a web console.

**Web server**

Hosts erwin Mart Administrator. You can use a web server of your choice. If you have not installed a web server, use the erwin Mart Server option and install Tomcat.

The following diagram shows the new architecture:

![Mart Architecture Diagram](image)
The new architecture has the following benefits:

- **Separate logical and physical users**: In the previous versions, Mart (or Model Manager) users required database level privileges to access the Mart functionality. The Mart database administrators added or deleted users in the Mart database. This approach is changed now. The logical users are separated from physical users, so Mart Administrators can create the Mart users without creating the corresponding database users.

- **Authentication through Active Directory services**: Earlier, if you wanted to provide access to a user group, you added each user individually. Now, because of the new architecture, you can use the Active Directory services and can provide access to the group. Anyone who is part of the group gets access.

- **Mart administration outside erwin® Data Modeler**: In the previous versions, Mart Administrators used erwin® Data Modeler for administrative activities such as managing permissions. This required non-modelers to know how to use erwin® Data Modeler. In the new architecture, the administration component is built on a separate layer on top of erwin® Data Modeler and is hosted on a web server. Mart Administrators can access erwin Web Admin from any computer and can perform administrative activities through a web console.

**Install a Mart or Upgrade a Mart?**

Use the following guidelines to determine if you must install a Mart or upgrade a Mart:

- If you are new to erwin® Data Modeler and have purchased the current version of Workgroup Edition, then install the current version of the Mart. Use the How to Install and Configure a Mart procedure that is appropriate for your Mart database.

- If you have any earlier release of r9 series Mart, then upgrade the Mart to the current version. Use the How to Upgrade any r9 Series Mart to the Current Version procedure to upgrade your Mart. The models that are created in any earlier release of r9 series are upgraded when a user connects to the current version Mart and opens the models.

- If you have an existing Mart and the version is r7.3 through r8.2.9, install the current version Mart. Use the How to Install and Configure a Mart procedure that is appropriate for your Mart database. After installing the Mart, use the Upgrade Mart utility to upgrade the Mart models from r7.3 through r8.2.9 to the current version.
Review the Prerequisites for a SQL Server Mart

Before you install the Mart components, help ensure that the minimum system requirements that are outlined in this topic are met.

You can use any of the following combinations to install erwin® Data Modeler, the Mart database, and the MartServer application:

- Install erwin Data Modeler, the Mart database, and the MartServer application on the same computer.
- Install erwin Data Modeler, the Mart database, and the MartServer application on different computers.
- Install erwin Data Modeler and the Mart database on one computer, and install the MartServer application on a different computer.
- Install erwin Data Modeler on one computer, and install the Mart database and the MartServer application on a different computer.

Ensure that you always install the MartServer application on Windows operating system.

System requirements to install the MartServer application

Hardware requirements (based on physical hardware performance, not a virtual environment):

Hardware requirements (based on physical hardware performance, not a virtual environment):

- 2 GHZ or higher dual core processor
- 4 GB RAM (8 GB or more for large marts)
- 4 GB of disk space or more as required to support your specific mart
Operating system:
- Microsoft Windows Server 2008 SP2, R2
- Microsoft Windows 7 SP1
- Microsoft Windows 8.1
- Microsoft Windows 10
- Microsoft Windows Server 2012, R2
- Microsoft Windows Server 2016
- Microsoft .NET Framework 3.5 and above
- All current Microsoft Windows critical updates are applied

Database:
- The Mart Server can use a standalone or can share an existing database server for a Microsoft SQL Server 2012, 2014, 2014 SP1, 2016 or 2016 SP1 database.
- The SQL Server 2012, 2014, 2014 SP1, 2016, and 2016 SP1 TRUSTWORTHY database property is no longer required for the mart. After you install this product, you can optionally reset this property to OFF.
- The database user account that is used to configure the Mart must have the dba_owner role assigned.
- (Optional) To use the Korean language, use the Korean_wansung_CI_AS character set. Select the character set while creating the Mart database (in the Collation field). For more information, see the SQL Server documentation.

erwin Mart Administrator web client:

Supported browsers:
- Microsoft Internet Explorer v10® or newer
- Mozilla Firefox® v30 or newer
- Google Chrome v30 or newer
- Apple Safari 6 or newer
Other requirements

Help ensure that the following additional requirements are met:

■ If you want to use Microsoft IIS as the web server, you have configured it.
■ The DBMS is installed and prepared for creating the Mart Database.
■ The Mart database is created. At least one user with administrator privileges is present.
■ If you want to add Windows Group users as Mart users, you have the Active Directory Server details.

**Note:** You can add Windows Group users as normal Mart users, but not as Mart administrators. A Mart administrator must be a server or Windows user.

Important disclaimer notice on all requirements

1. The requirements that are mentioned previously define the minimum requirements which permit the application to run with reasonable performance based on a small business use case scenario. The actual requirements for an enterprise-wide use case based on larger models and configurations require significantly greater resources to obtain acceptable performance.

2. These requirements are based on actual physical hardware (no virtual environment) and the following assumptions:
   ■ Minimal to no network overhead (both the database and application servers are locally installed)
   ■ Vendor’s default install of the current version of their software (with all current service or fix packs)
   ■ No other applications sharing the defined hardware configuration (for example, a “clean” machine)

Any other hardware/software configurations are acceptable as long as they provide the same (or better) performance characteristics identified.
Create a SQL Server Database

If you are a DBA or a system administrator responsible for installing the software on a Microsoft SQL Server database management system, perform the following tasks:

1. Use a graphical user interface (GUI) tool, ISQL (all versions), SQL Administrator, or Enterprise Manager to create the Mart database. If a GUI tool is not available, you can use ISQL to type in the appropriate commands manually.

   Your database should meet the following criteria:
   - The initial size of the database file should be set to 60 MB.
   - The initial size of the transaction log file should be set to 50 MB.
   - Set the maximum file size to unrestricted file growth for both files (recommended, but not required).
   - Increase the Set Auto grow file by 10 percent (recommended, but not required).

   The new database is owned by the user who created it.

   Set the Truncate Log on Checkpoint option and have the server generate checkpoints frequently. By selecting this option, the log is emptied periodically and should not fill up and cause rollbacks.

   Note: For best performance ensure that separate devices are used to store the data and the transaction log.

2. Verify tempdb size.

   Significant temporary space is required for installation and use. The temporary segments need at least 16 MB of available space. You should also increase available space as the number of concurrent users increase.

Microsoft SQL Server 2005 Permissions

For a SQL Server 2005 Mart, you must have the bulkadmin permission designated. The ability to do bulk inserts (which the public permission permitted previously) is no longer part of the public permission. As the administrator, you explicitly define this permission. Assign the bulkadmin permission to the physical user that connects to the database. If you do not define the permission, when you create a mart using a SQL Server 2005 database, and save it, an error appears.
Specify Use of Foreign Characters With Microsoft SQL Server 2005

Follow these steps:

1. Click Run on the Start menu.
2. Enter `regedit`.
   The Registry Editor opens.
3. Verify or add the following registry entry:
   
   ```
   [HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\MSSQLServer\Client\DB-Lib]
   "AutoAnsiToOem"="ON"
   "UseIntlSettings"="ON"
   ```
4. Click File, Exit.

Your configuration is set to recognize foreign language characters in your models.

Install erwin Mart Server

The Mart Server and Mart Admin war files are deployed on a Web server. You can either use an existing web server, or install the web server through the erwin MartServer r9.8 Installation Wizard. You must install erwin Mart Server and configure it regardless of whether you use Mart Server as a Windows service.

**Note:** Ensure that you have reviewed the Install a Mart or Upgrade a Mart topic before proceeding.

Follow these steps:

1. Do one of the following tasks:
   - Insert the installation DVD and select Mart Server Installation.
   - Download the EDMMS98 (32-bit or 64-bit).exe file from the online erwin product page and run it.

The erwin MartServer r9.8(32-bit or 64-bit) Installation Wizard appears.
2. Go through the wizard steps to install erwin Mart Server.

Depending on the options you select, erwin Mart Server and/or Java Runtime Environment (JRE) and Tomcat are installed.

**Note:** If Java (any version) is already available in the computer and the environment variable JRE_HOME is set, the installer overwrites JRE_HOME with the new Java path. The JRE version that is shipped with the installer is 1.8.

3. From the Windows Start menu, click All Programs, erwin, Mart Server r9.8(32-bit or 64-bit), Configure MartServer.

The erwin Mart Configuration dialog appears.

**Configure the erwin Mart Server**

1. Complete the following fields in the Mart Server tab:

   **Database Type**
   - Specifies the database server type.

   **Port No.**
   - Specifies the port number of the database server.

   **Server Name**
   - Specifies the name of the database server where you have installed the Mart database. For example, suppose that you are using SQL Server as the Mart database. Enter the name of the computer where SQL Server is installed.

   **Instance Name**
   - Specifies the name of the database instance.

   **Database Name**
   - Specifies the name of the Mart database.

   **Note:** If you are installing the Mart for the first time, use a new database. Do not use an existing database that was created for r7.3 through r8.2.9 Mart. If you are upgrading the Mart from any earlier release of r9 series to the latest release, use the corresponding Mart database.

   **User Name**
   - Specifies the user name to connect to the Mart database. Enter the name of a user that is authenticated by the Mart database.

   **Note:** Windows authentication (User Name field) is not supported for connecting to the Mart database from the Configure Mart Server window.
Password

Specifies the password to connect to the Mart database.

**Note:** The following fields—Domain Controller Name, Domain/User Name, and Password are required only if you are using the Active Directory authentication. You can use the Active Directory authentication to initialize the Mart and to log in to erwin Mart Administrator.

**Domain Controller Name**

Specifies the fully qualified name of the Active Directory Server (Domain Controller). Enter the name in the following format:

LDAP://server/distinguished-name

**Example:** ldap://mktgna:3268/dc=abc, dc=com

Here, mktgna is the server name. You can provide either the name of the server or the IP address. 3268 is the port number to which the server listens. 

dc=abc, dc=com is the distinguished-name. The distinguished name is the full path of the object.

**Note:** If you do not know the Domain Controller Name, use the *Nltest* command or talk to your System Administrator.

**Domain/User Name**

Specifies the domain name and user name in the <domain name>/<user name> format.

**Password**

Specifies the password of the domain user.

**Configure erwin Mart Administrator**

1. Enter the following information in the Mart Administrator tab:

   **Server Name**

   Specifies the name of the computer where the Web Server is present. For example, if you are using Tomcat, enter the name of the computer where Tomcat is installed.

   **Default:** localhost

   **Port Number**

   Specifies the port number on which the Web Server is running.

   **Default:** 18170
Application Name
  Specifies the application name with which the Web Server is identified.

  Default: MartServer

Transport Layer Security
  Specifies if you want to connect to the Mart through a secured connection (SSL). Select this check box if you have implemented SSL.

Hosting Server
  Specifies that you want to use the IIS web server to connect to the Mart. Select this check box only if you have configured IIS.

IIS Port
  Specify the IIS port number that you want to use. This field is enabled only if you select the Use IIS check box. The default is 80.

Account Lockout Duration (Seconds)
  Specify the duration (in seconds) for which an account should be locked whenever an incorrect password is entered five consecutive times. By default, it is set to five minutes (300 seconds). At the most, you can set it to 30 days (2592000 seconds).

2. Click Configure.

  The erwin Mart Administrator and the Mart Server are configured.

More information:

Configure IIS Web Server (see page 150)
Implement SSL for IIS (see page 152)
Enable SSL for Tomcat

SSL enables you to access the Mart through a secured connection. You can enable SSL for Tomcat—the default web server, when you are installing the Mart for the first time.

Follow these steps:

1. If the Mart Server service is running, stop it. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8 (32-bit or 64-bit), Stop MartServer Service to stop the web server.

2. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8 (32-bit or 64-bit), Enable SSL for Tomcat Webserver. SSL is enabled for Tomcat and a security certificate is created. You must install this security certificate on all the computers from where you want to access the Mart.

3. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8 (32-bit or 64-bit), Configure MartServer. The erwin Mart Configuration dialog appears.

4. Go to the Mart Administrator tab and select the Transport Layer Security check box.

5. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8 (32-bit or 64-bit), Start Mart Server Service.

6. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8 (32-bit or 64-bit), erwin Mart Administrator r9.8 (32-bit or 64-bit).

   The erwin Mart Administrator home page appears and displays HTTPS in the address bar. If a certificate error appears, click Proceed Anyway to begin the session.

   **Important!** If you want to connect to an SSL enabled Mart through API or the Mart Upgrade utility, you must first install the security certificate on the corresponding computer. Install the certificate through the data modeling tool. If you do not install the security certificate, the Mart Upgrade utility and the API will not be able to connect to the SSL enabled Mart.

Disable SSL and Access the Mart Through a Normal Connection

You can disable SSL at any time and access the Mart through a normal connection.

Follow these steps:

1. If the Mart Server Service is running, stop it. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8 (32-bit or 64-bit), Stop Mart Server Service.

2. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8 (32-bit or 64-bit), Disable SSL.

3. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8 (32-bit or 64-bit), Configure MartServer.
The erwin Mart Configuration dialog appears.

4. Go to the Mart Administrator tab and clear the Transport Layer Security check box.

5. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8 (32-bit or 64-bit), Start Mart Server Service.

6. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8 (32-bit or 64-bit), erwin Mart Administrator r9.8 (32-bit or 64-bit).

   The erwin Mart Administrator home page appears and displays HTTP in the address bar.

**Use Mart Server as a Windows Service**

The current version of the Mart provides two ways to start the web server that hosts Mart Server:

- Start the web server manually.
- Use a Windows service to start the web server.

For example, if you have used Tomcat as the web server to host Mart Server, you can start Tomcat in two ways:

- Start Tomcat through the startup.bat file or through a shortcut to this file.
- Use a Windows service to start Tomcat.

The benefits of using a Windows service to start a web server are as follows:

- Any user with administrative privileges on a computer can start the Windows service, whereas, only designated users can start a web server manually.
- A Windows service runs regardless of whether a user has logged in. A manually-started web server shuts down when the user who started it logs out.

**Follow these steps:**

1. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8 (32-bit or 64-bit), Create MartServer Service to create the MartServer Windows service.
   
   Creating the service is a one-time task. After the service is created, you only have to start and stop the service.

2. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8 (32-bit or 64-bit), Start MartServer Service to start the web server.
Initialize a SQL Server Mart

When you access the Mart database through erwin Mart Administrator for the first time, you must initialize the database. You can initialize the database using a database authenticated user or a Windows authenticated user.

Note: Before you proceed, verify that you have installed a DBMS, created the Mart database and run the initial queries. If the Mart is already initialized, the Login page appears.

Follow these steps:

1. If you are using MartServer as a Windows service, help ensure that the service is started. If not, from the Windows Start menu, click All Programs, erwin, Mart Server r9.8(32-bit or 64-bit), Start Mart Server to start the Mart Server.

   A Windows command prompt window appears and indicates when the server starts.

2. From the Windows Start menu, click All Programs, erwin, Mart Server r9.8(32-bit or 64-bit), erwin Mart Administrator r9.8(32-bit or 64-bit).

   erwin Mart Administrator opens in your default browser.

3. Complete the following fields:

   Username
   
   Defines the user name with which you want to access the Mart. If you are using a Windows-authenticated user, enter the name in the <domain name>/<username> format.

   Password
   
   Defines the password for the user name.

   Note: A password should fulfill the following criteria:
   
   ■ Contains at least 1 lowercase character
   ■ Contains at least 1 uppercase character
   ■ Contains at least 1 number
   ■ Is minimum 6 characters in length
   ■ Is maximum 130 characters in length

   Apart from the above criteria, special characters are optional.
Confirm Password

Confirms the password that you entered in the previous field.

Email Address

Defines the email address for the user account that you are creating.

4. Click Initialize.

The user name is added as an administrator of Mart, Mart is initialized, and the Login web page appears. Initializing is a one-time task. After Mart is initialized, the user who initialized must log in first. Later, any other user who wants to use erwin Mart Administrator can log in.

Note: The user name that is entered here is an application level user and not a database user. Remember the password that you have entered here, because without the password you cannot log in to erwin Mart Administrator for the first time.

In the previous releases, only a server user was allowed to initialize a Mart. From release r9.6, a Windows-authenticated user can also initialize a Mart. Further, a Windows-authenticated user can log in to a Mart as a Windows user.

To initialize a Mart with a Windows-authenticated user, follow these steps:

1. Provide the Active Directory details with user credentials in the Active Directory Details section in the erwin Mart Configuration dialog.

2. Open erwin Mart Administrator, enter the user name in the <domain name>/<user name> format. For more information about how to initialize a Mart, see the Workgroup Edition Implementation and Administration Guide.

To log in as a Windows-authenticated user, follow these steps:

This procedure describes how to enable a Windows-authenticated user log in to a Mart that is already initialized. Use this procedure if the Mart is initialized with either a server user or a Windows-authenticated user.

1. Ensure that you have provided the Active Directory details with user credentials in the Active Directory Details section in the erwin Mart Configuration dialog.

2. Log in to the Mart as an administrator and add the required user as a Windows user in the Mart. Ensure that the user belongs to the Active Directory that was provided at the time of configuring the Mart.

   Now the Windows-authenticated user can log in to erwin Mart Administrator by providing the user name in the <domain name>/<user name> format.

Note: A local Windows user who does not belong to a domain or who is not part of an Active Directory cannot log in to the Mart as a Windows user.
Log In to erwin Mart Administrator and Configure Settings

After the Mart is initialized, the user who initialized must log in first.

**Note:** If you enter an incorrect password five consecutive times, your account will be locked for five minutes (300 seconds) by default. You can change the time for which the account stays locked as follows:

1. From Windows Start menu, click All Programs, erwin, Mart Server r9.8(32-bit or 64-bit), Configure MartServer.
   
   The erwin Mart Configuration dialog appears.

2. On the Mart Administrator tab, edit the value of the Account Lockout Duration (Seconds) field to an appropriate value. At the most, you can set it to 30 days (2592000 seconds).

When you log in to Mart for the first time, configure it per the requirements of your organization. You can configure the following settings:

- Default profile for the model creator
- Use default password
- Email notification

**Follow these steps:**

1. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8(32-bit or 64-bit), erwin Mart Administrator r9.8(32-bit or 64-bit).
   
   The erwin Mart Administrator home page appears. If you have implemented SSL, HTTPS appears in the address bar.

2. Use the credentials with which you initialized the Mart and log in.

3. Click Settings.

4. Complete the following fields:

   **Default profile for model creator**

   Specifies the profile that is assigned to a user on a model. This profile is assigned whenever a user creates a model and saves it to Mart for the first time. The user inherits the permissions of the default profile selected here on the model that is saved. For example, suppose that User1 is assigned with Modeler profile and the System Administrator selects Architect as the default profile for model creator. If User1 creates Model1 and saves it to Mart, for Model1, User1 inherits the permissions of Architect. Now, suppose that the System Administrator selects Viewer as the default profile for model creator, and suppose that User1 creates Model2 and saves it to Mart. For Model2, User1 inherits the permissions of Viewer.

   **Use Default Password**
Specifies the default password that you want to use for new users and for resetting passwords, in the absence of an SMTP server for emails.

**Note:** Select this option only if you do not have an SMTP server that is configured for emails.

**SMTP host name**

Specifies the name of the SMTP host. Enter the name in the mail.domain.com format. Notification emails are sent from this server.

**Port number**

Specifies the port number of the SMTP server. The default port number is 25. If your company is using an alternate port number for the mail server, specify that port number.

**Authenticate**

Specifies whether transactions with the SMTP server are authenticated. Select the check box to authenticate.

**User name**

Specifies the user name to authenticate the SMTP server. Select the Authenticate check box to enable authentication.

**Password**

Specifies the password to authenticate the SMTP server. Select the Authenticate check box to enable authentication.

**Administrator email**

Specifies the email ID of the Mart administrator. Notifications to Mart users are sent from this ID.

**No-reply email from**

Specifies the email ID from which administrative emails such as the password reset email are sent.

**Use TLS Connection**

Specifies whether transactions with the SMTP server use a Transport layer Security (TLS). If you intend to use a TLS connection, ensure that the User name and Administrator email correspond to each other.

**Note:** Select this option only if you want to use a TLS connection.

5. Click Save.

Mart options are configured.

You have installed and configured erwin DM Mart.
How to Upgrade any r9 Series Mart to the Current Version

If you are using any earlier release of r9 series and you want to upgrade it to the latest release, upgrade the Mart Server and the Mart database. The Mart server program is upgraded, so you must implement the upgraded software.

Important! The current Mart is designed to work with only the current version of erwin® Data Modeler. If you try to connect the current Mart with an older version erwin® Data Modeler such as r9.0.0, it may corrupt the Mart and cause unexpected behavior.

The following diagram illustrates how System Administrators can upgrade a Mart from any earlier release of r9 series to the latest release:

Complete the following tasks to upgrade a Mart of any earlier release of r9 series to the latest release:

1. Review the prerequisites.
2. Upgrade the Mart Server.
3. Configure the Mart Server.
4. Restart the Mart Server service.
5. Log In to erwin Web Admin.
Review the Prerequisites

Review the following prerequisites before you start the upgrade process:

If the Mart database is an Oracle database, the default tablespaces that were used for initializing the any earlier release of r9 series Mart are available for the latest release.

Upgrade the Mart Server

If you are upgrading a Mart from any earlier release of r9 series to the latest release, upgrade the Mart Server.

**Note:** See the Install a Mart or Upgrade a Mart topic before proceeding.

**Follow these steps:**

1. If you are running MartServer as a Windows service, stop the service and delete it.
   
   **Note:** If you upgrade the Mart Server without stopping the service, Mart Server may not start after you complete the upgrade process.

2. Download and run the EDMMS98(32-bit or 64-bit).exe file from the erwin Support site.
   
   The erwin Mart Server r9.8(32-bit or 64-bit) Install Shield Wizard dialog appears.

3. Follow the wizard.
   
   The Mart Server is upgraded.

4. Restart your computer.

Configure the Mart Server

To connect to the latest Mart, you must configure the Mart Server. Use the same database that you have used for the r9.0.0 Mart (or any earlier release of r9 series Mart).

**Note:** See the Upgrade Considerations topic before proceeding.
Follow these steps:

1. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8 (32-bit or 64-bit), Configure MartServer.

   The erwin Mart Configuration dialog appears.

**Configure the erwin Mart Server**

1. Complete the following fields in the Mart Server tab:

   - **Database Type**
     - Specifies the database server type.

   - **Port No.**
     - Specifies the port number of the database server.

   - **Server Name**
     - Specifies the name of the database server where you have installed the Mart database. For example, suppose that you are using SQL Server as the Mart database. Enter the name of the computer where SQL Server is installed.

   - **Instance Name**
     - Specifies the name of the database instance.

   - **Database Name**
     - Specifies the name of the Mart database.

   **Note:** If you are installing the Mart for the first time, use a new database. Do not use an existing database that was created for r7.3 through r8.2.9 Mart. If you are upgrading the Mart from any earlier release of r9 series to the latest release, use the corresponding Mart database.

   - **User Name**
     - Specifies the user name to connect to the Mart database. Enter the name of a user that is authenticated by the Mart database.

   **Note:** Windows authentication (User Name field) is not supported for connecting to the Mart database from the Configure Mart Server window.
Password

Specifies the password to connect to the Mart database.

Note: The following fields--Domain Controller Name, Domain/User Name, and Password are required only if you are using the Active Directory authentication. You can use the Active Directory authentication to initialize the Mart and to log in to erwin Mart Administrator.

Domain Controller Name

Specifies the fully qualified name of the Active Directory Server (Domain Controller). Enter the name in the following format:

LDAP://server/distinguished-name

Example: ldap://mktgna:3268/dc=abc, dc=com

Here, mktgna is the server name. You can provide either the name of the server or the IP address. 3268 is the port number to which the server listens.

dc=abc, dc=com is the distinguished-name. The distinguished name is the full path of the object.

Note: If you do not know the Domain Controller Name, use the Nltest command or talk to your System Administrator.

Domain/User Name

Specifies the domain name and user name in the <domain name>/<user name> format.

Password

Specifies the password of the domain user.

Configure erwin Mart Administrator

1. Enter the following information in the Mart Administrator tab:

Server Name

Specifies the name of the computer where the Web Server is present. For example, if you are using Tomcat, enter the name of the computer where Tomcat is installed.

Default: localhost

Port Number

Specifies the port number on which the Web Server is running.

Default: 18170
Application Name

Specifies the application name with which the Web Server is identified.

Default: MartServer

Transport Layer Security

Specifies if you want to connect to the Mart through a secured connection (SSL). Select this check box if you have implemented SSL.

Hosting Server

Specifies that you want to use the IIS web server to connect to the Mart. Select this check box only if you have configured IIS.

IIS Port

Specify the IIS port number that you want to use. This field is enabled only if you select the Use IIS check box. The default is 80.

Account Lockout Duration (Seconds)

Specify the duration (in seconds) for which an account should be locked whenever an incorrect password is entered five consecutive times. By default, it is set to five minutes (300 seconds). At the most, you can set it to 30 days (2592000 seconds).

2. Click Configure.

The erwin Mart Administrator and the Mart Server are configured.

Restart the Mart Server Service

When you modify the details of the Mart Server and Mart Administration programs, restart the Mart Server service.

Follow these steps:

1. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8(32-bit or 64-bit), Stop MartServer Service to stop the Mart Server service.

2. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8(32-bit or 64-bit), Start MartServer Service to start the Mart Server service.
Log In to erwin Mart Administrator

Log in to erwin Mart Administrator to verify if you have successfully upgraded the Mart Server from any earlier release of r9 series to the latest release.

Follow these steps:

1. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8(32-bit or 64-bit), erwin Mart Administrator r9.8(32-bit or 64-bit).
   The erwin Mart Administrator log in page appears. If you have implemented SSL, HTTPS appears in the address bar.
2. Use the credentials with which you initialized the Mart and log in.
   The erwin Mart Administrator home page appears.

The models that are created in any earlier release of r9 series are upgraded when a user connects to the latest release Mart and opens the models.
Change the Mart Database Server

Sometimes, you may change the server on which the Mart database is installed, or you may restore the Mart database with a new name. When there is a change the server name or database name, reconfigure the MartServer.

**Follow these steps:**

1. Back up your Mart database.
2. Restore the database on the designated server.
3. If you use the same computer for Mart Server and restore the database in a different name, include the new database name in the erwin Mart Configuration dialog.

   From the Windows Start menu, open the erwin Mart Configuration dialog. In the Mart Server tab, Database Name field, enter the new name with which the database is restored. Enter the current user name and password to access the database. If wrong information is provided here, you may be able to install the Mart, but you cannot log in and cannot use it.

4. If you use a different computer for Mart Server and restore the database in the same name, install the Mart Server on the new computer.

   Use the Install erwin Mart Server procedure and install the Mart Server. In the Mart Server tab, Server Name field, enter the name of the new server where the database is restored. Enter the current user name and password to access the database. If wrong information is provided here, you may be able to install the Mart, but you cannot log in and cannot use it.

5. Stop the MartServer service and start it again.

6. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8(32-bit or 64-bit), erwin Mart Administrator r9.8(32-bit or 64-bit).

   Enter the credentials of the Mart administrator and log in.

**Troubleshooting**

This section explains the errors that you can encounter while installing and configuring Mart, and how you can troubleshoot them.

**Note:** The Mart Server log files are available in the following location:

Windows 7: `{user.home}/AppData/Local/erwin Mart Server/logs/application.log`
Unable to Create MartServer Service

Symptom:
If Mart Server is upgraded to the latest version without stopping and deleting the Mart Server service of the earlier version, creating a new Mart Server service does not work.

Solution:
Run the `sc Delete MartServer` command to delete the Mart Server Service from command prompt and then try to create a Mart Server Service in the new version.

Port out of range

Symptom:
Whenever I connect to the web server, I get the following error message:

`java.lang.IllegalArgumentException: port out of range 80821.`

Solution:
Type the correct port number in the Configure erwin Mart Administrator’s Server dialog and then restart your web server.

Call failed on the server

Symptom:
When I try to connect to the Mart server, I get the following error:

`500 The call failed on the server; see server log for details`

Solution:
The probable reasons for this error could be one of the following reasons:

- The server name is not correct.
- The application name is not correct. By default, the application name is MartServer and it is case-sensitive.

Type the correct server name and application name in the erwin Mart Administrator’s Server dialog and the Configure MartServer Details dialog. Restart the web server.
Application Internal Error

**Symptom:**
When I try to connect to the database, I get the following error:

Application Internal Error

**Solution**
You get this error when the MartServer application is unable to connect to the required database. The following reasons are probable for this error:

- The database details that are provided in the Configure MartServer Details dialog are incorrect.
- The username and the password for the database are incorrect.
- The database is not present.
- The port number for the database is incorrect.
- The network is down.

Ensure that you enter the correct details of your database in the Mart Server tab of the erwin Mart Configuration dialog.

ORA-12514 TNS listener does not currently know of service requested in connect descriptor

**Symptom:**
When I try to open the erwin Mart Administrator page, I get the Application Internal Error. The Tomcat windows shows the following error message:

ORA-12514, TNS:listener does not currently know of service requested in connect descriptor

**Solution:**
Use a fully qualified instance name when starting the Mart Server.
Mart already exists. Specify another database name

Symptom:
When I try to connect to the Mart, I get the following error message:

An earlier mart is already present in the database you are trying to initialize. This process can not be continued. Please specify another database name to continue.

Solution:
You get this error when you connect to an old Mart that you have used for erwin DM Release r7 series, r8 series, or Beta release of any r9 series release.
Create a database and provide its details in the Configure MartServer Details dialog.

Initialize page is not loading in Internet Explorer

Symptom:
When I type the URL to initialize my Mart in Internet Explorer, the Initialize Mart page is taking a long time to load.

Solution:
The Initialize Mart page does not load because the Active Scripting option in Internet Explorer is disabled.

To enable Active Scripting, follow these steps:
1. In Internet Explorer, click Tools, Internet Options.
2. In the Security tab, click the Custom Level button.
   The Security Settings – Local Intranet Zone window opens.
3. From the list of options, locate Scripting, Active Scripting, and select Enable. Click OK.
4. Restart Internet Explorer and enter the URL to initialize Mart.
   The Mart Initialize page opens.
Troubleshooting

The Tomcat server is not starting properly. The Configure button is disabled.

Symptom:
My administrator has given me the Administrator rights and when I start the Tomcat server, I get a series of errors. Also, I cannot click the Configure button in the configuration dialog because it is disabled.

Solution:
Right-click Start Server, and click Run as Administrator.
The Tomcat server starts without any error, and the configuration button is enabled.

A connection with the server could not be established

Symptom:
When I try to connect to the web server from erwin Data Modeler, I get the following error message:
A connection with the server could not be established

Solution:
Verify that you have provided the correct port number and then reconnect to the web server.

The server name or address could not be resolved

Symptom:
When I try to connect to the web server from erwin Data Modeler, I get the following error message:
The server name or address could not be resolved

Solution:
Verify that the server name where the web server is installed is correct and then reconnect to the server.

Note: If erwin Data Modeler and the web server are installed on the same computer, you can give the server name as localhost. Suppose that erwin® Data Modeler and the web server are installed on different computers. The server name is the name of the computer where the web server is installed.
Invalid user ID or password

**Symptom:**
When I try to connect to the server, I get the following error message:

Invalid user ID or password. Please try again to login.

**Solution:**
Type the correct user name and password.

**Note:** The user must be an application level user and not a database user.

Error 12029

**Symptom:**
When I connect to the web server, I get the following error message:

Error 12029

**Solution:**
Restart the web server.

Unable to load the web page from my web browser

**Symptom:**
When I type the URL in Internet Explorer or Google Chrome to connect to the web server, I get the following error messages:

**For Internet Explorer**

Internet Explorer cannot display the webpage

**For Google Chrome**

Oops! Google Chrome could not connect to localhost:18170

**Solution:**
Restart the web server.
Internet Explorer Redirects to a Different Link

**Symptom:**
Suppose that I install erwin Mart Server on a fresh machine. If I enable the SSL option and I invoke erwin Mart Administrator, Internet Explorer redirects the page to res://ieframe.dll/.

**Solution:**
Internet Explorer versions 8 through 10 have a security enhancement that blocks the following types of sites:
- Sites that have self-signed certificates
- Sites that have self-signed certificates where the certificate does not match the URL

**Follow any of these steps:**
- Install the certificate in the Trusted Root Certification Authorities store.
- Add the site to trusted sites.
- Set the Internet Explorer Security level to Medium Low.
**I have a very long Windows user name and I cannot log in to the Mart through erwin Data Modeler**

**Symptom:**
I have added a very long Windows user name similar to "Magdalena.Chalamalasetti" using the Mart Administrator. When the user tries to log in to the Mart through erwin® Data Modeler, the name is truncated to "US\Magdalena.Chalamas" and the user cannot log in.

**Solution:**
The name is truncated due to a limitation with Windows. The Windows API returns the legacy user name that is limited to 20 characters. If the length of a user name exceeds 20 characters, for example, "US\Magdalena.Chalamalasetti", the name is displayed as "US\Magdalena.Chalamas" in the Connect to Mart dialog.

You can resolve this in one of the following ways:
- Type the first 20 characters of the user name when you add the user as a Windows User, in the Mart Administrator. For example, instead of typing "US\Magdalena.Chalamalasetti", type "US\Magdalena.Chalamalas".
- Use a Windows Group instead of the user's domain name. Using your Windows domain controller software, add the user to a Windows Group, and then add the group as a User Group in the Mart Administrator. For more information about how to add a User Group, see erwin Data Modeler r9 Workgroup Edition: Support for Directory Services video.

---

**SSL Certificate Error**

**Symptom:**
When you open Mart Administrator from Mart Server that is configured with an SSL certification, an SSL certificate error appears.

**Solution:**
1. Replace localhost in the Mart Server URL with your computer name.
   - https://localhost:12345/MartAdmin/
   - https://<computer_name>:12345/MartAdmin/
2. Use the updated URL to access the Mart Server
Unable to save a model to Mart with an existing model name

Symptom:

When you save a model to Mart with an existing model name, a dialog with the following text appears.

Model '<model name>' already exists in library '<mart name>'. Rename the new model name

Solution:

Save the model with a different name.
Chapter 5: Install and Configure a SAP ASE Mart

This section describes how you can install and configure a Mart on a SAP ASE database.

This section contains the following topics:
- How to Install and Configure a SAP ASE Mart (see page 115)
- How to Upgrade any r9 Series Mart to the Current Version (see page 133)
- Change the Mart Database Server (see page 139)
- Troubleshooting (see page 139)

How to Install and Configure a SAP ASE Mart

In the previous versions, erwin DM connected to the Mart database through the database client software. Now, the application connects to the Mart database through a web server. The database client software is no longer required.

The Mart comprises the following components:

**Database**
Stores the user data for the Workgroup Edition. You can use a SAP Adaptive Server Enterprise (ASE) 15.0 through 15.7 and SAP ASE 16, or the certified version, SAP ASE 16 SP02 database for the Mart database. You must use a new database and not an existing database that was created for an older version of the data modeling tool.

**Applications**
Includes a web-based component named erwin Mart Administrator that helps you manage the Mart through a web console.

**Web server**
Hosts erwin Mart Administrator. You can use a web server of your choice. If you have not installed a web server, use the erwin Mart Server option and install Tomcat.

If you are using the Workgroup Edition, you must install and configure erwin Mart Administrator.
The following diagram illustrates how to install and configure a Mart:

Complete the following steps to install and configure a Mart:

1. Review the Prerequisites for a SAP ASE Mart.
2. Create a SAP ASE Database. (see page 122)
3. Install erwin Mart Server.
4. Use MartServer as a Windows Service.
5. Initialize a SAP ASE Mart.
6. Log in to erwin Mart Administrator and configure settings.
Mart Architecture

In the previous versions, erwin DM connected to the Mart database through the database client software. Now, the application connects to the Mart database through a web server. The database client software is no longer required. The web server includes a web-based administration console—erwin Mart Administrator. If you are using the Workgroup Edition, you must install and configure erwin Mart Administrator.

The Mart comprises the following components:

Database
Stores the user data for the Workgroup Edition. You can use a SAP Adaptive Server Enterprise (ASE) 15.0 through 15.7 and SAP ASE 16, or the certified version, SAP ASE 16 SP02 database for the Mart database. You must use a new database and not an existing database that was created for an older version of the data modeling tool.

Applications
Includes a web-based component named erwin Mart Administrator that helps you manage the Mart through a web console.

Web server
Hosts erwin Mart Administrator. You can use a web server of your choice. If you have not installed a web server, use the erwin Mart Server option and install Tomcat.

The following diagram shows the new architecture:
The new architecture has the following benefits:

- **Separate logical and physical users:** In the previous versions, Mart (or Model Manager) users required database level privileges to access the Mart functionality. The Mart database administrators added or deleted users in the Mart database. This approach is changed now. The logical users are separated from physical users, so Mart Administrators can create the Mart users without creating the corresponding database users.

- **Authentication through Active Directory services:** Earlier, if you wanted to provide access to a user group, you added each user individually. Now, because of the new architecture, you can use the Active Directory services and can provide access to the group. Anyone who is part of the group gets access.

- **Mart administration outside erwin® Data Modeler:** In the previous versions, Mart Administrators used erwin® Data Modeler for administrative activities such as managing permissions. This required non-modelers to know how to use erwin® Data Modeler. In the new architecture, the administration component is built on a separate layer on top of erwin® Data Modeler and is hosted on a web server. Mart Administrators can access erwin Web Admin from any computer and can perform administrative activities through a web console.

**Install a Mart or Upgrade a Mart?**

Use the following guidelines to determine if you must install a Mart or upgrade a Mart:

- **If you are new to erwin® Data Modeler and have purchased the current version of Workgroup Edition, then install the current version of the Mart. Use the How to Install and Configure a Mart procedure that is appropriate for your Mart database.**

- **If you have any earlier release of r9 series Mart, then upgrade the Mart to the current version. Use the How to Upgrade any r9 Series Mart to the Current Version procedure to upgrade your Mart. The models that are created in any earlier release of r9 series are upgraded when a user connects to the current version Mart and opens the models.**

- **If you have an existing Mart and the version is r7.3 through r8.2.9, install the current version Mart. Use the How to Install and Configure a Mart procedure that is appropriate for your Mart database. After installing the Mart, use the Upgrade Mart utility to upgrade the Mart models from r7.3 through r8.2.9 to the current version.**
Review the Prerequisites for a SAP ASE Mart

Before you install the Mart components, help ensure that the minimum system requirements that are outlined in this topic are met.

You can use any of the following combinations to install erwin® Data Modeler, the Mart database, and the MartServer application:

- Install erwin Data Modeler, the Mart database, and the MartServer application on the same computer.
- Install erwin Data Modeler, the Mart database, and the MartServer application on different computers.
- Install erwin Data Modeler and the Mart database on one computer, and install the MartServer application on a different computer.
- Install erwin Data Modeler on one computer, and install the Mart database and the MartServer application on a different computer.

Ensure that you always install the MartServer application on Windows operating system.

System requirements to install the MartServer application

Hardware requirements (based on physical hardware performance, not a virtual environment):

Hardware requirements (based on physical hardware performance, not a virtual environment):

- 2 GHZ or higher dual core processor
- 4 GB RAM (8 GB or more for large marts)
- 4 GB of disk space or more as required to support your specific mart
Operating system:
- Microsoft Windows Server 2008 SP2, R2
- Microsoft Windows 7 SP1
- Microsoft Windows 8.1
- Microsoft Windows 10
- Microsoft Windows Server 2012, R2
- Microsoft Windows Server 2016
- Microsoft .NET Framework 3.5 and above
- All current Microsoft Windows critical updates are applied

Database:
- The Mart Server can use a standalone or can share an existing database server for a SAP ASE 15.0 through 15.7 and SAP ASE 16 database, or the certified version, SAP ASE 16 SP02.
- The dbo role is necessary only during the installation or upgrade. You can revoke the dbo role for the installer after the installation or upgrade is complete.

(Optional) To use the Korean language, configure the server manually to use Cp949, Utf8, or eucksc character set. These character sets apply to a 64-bit Windows 7 computer running the Korean language pack. When you configure the server, help ensure that you perform the following tasks:
1. Add the language and set it as default.
2. Select the character set and set it as default.
   **Note:** PC (MS) Korean stands for cp949 character set. Extended Unix Code for KSC-5601 stands for eucksc character set. Unicode 3.1 UTF-8 Character Set stands for utf8 character set.
3. Select the default sort order.
   For more information, see the Sybase documentation. Create the Mart database after you perform the tasks that are mentioned earlier.

**erwin Mart Administrator web client:**

Supported browsers:
- Microsoft Internet Explorer v10+ or newer
- Mozilla Firefox® v30 or newer
- Google Chrome v30 or newer
- Apple Safari 6 or newer
Other requirements

Help ensure that the following additional requirements are met:

- If you want to use Microsoft IIS as the web server, you have configured it.
- The DBMS is installed and prepared for creating the Mart Database.
- The Mart database is created. At least one user with administrator privileges is present.
- If you want to add Windows Group users as Mart users, you have the Active Directory Server details.

**Note:** You can add Windows Group users as normal Mart users, but not as Mart administrators. A Mart administrator must be a server or Windows user.

Important disclaimer notice on all requirements

1. The requirements that are mentioned previously define the minimum requirements which permit the application to run with reasonable performance based on a small business use case scenario. The actual requirements for an enterprise-wide use case based on larger models and configurations require significantly greater resources to obtain acceptable performance.

2. These requirements are based on actual physical hardware (no virtual environment) and the following assumptions:
   - Minimal to no network overhead (both the database and application servers are locally installed)
   - Vendor’s default install of the current version of their software (with all current service or fix packs)
   - No other applications sharing the defined hardware configuration (for example, a “clean” machine)

Any other hardware/software configurations are acceptable as long as they provide the same (or better) performance characteristics identified.
Create a SAP ASE Database

The DBA and the system administrator responsible for installing the software on a SAP ASE database management system perform the following tasks:

1. Use a graphical user interface (GUI) tool, ISQL (all versions), SQL Administrator, Sybase Central Java, or Enterprise Manager to create the mart database. If a GUI tool is not available, use ISQL to type the appropriate commands manually.

   Your database must meet the following criteria:
   - The size of the data device you create determines the size of the database. The minimum database size is 32 MB so there has to be at least one device that is 32 MB. Create the data device on a different disk (and disk controller) than the transaction log.
   - For optimum performance, verify that separate devices are used to store the data and the transaction log. For example, you can increase performance by creating a 50-MB data device and a 25-MB log device. A minimum of 40 MB of disk space (data and log) is required.

2. Verify the Stored Procedure Cache.

   Set the Stored Procedure Cache size to at least 8 MB. Setting it higher improves performance, especially when many users are accessing the server concurrently. Setting it lower results in fatal errors and rollbacks when the Stored Procedure Cache size is exceeded.

   **Note:** The installation creates more than 100 stored procedures. The client invokes these stored procedures to control changes to the data in the database.

3. Verify tempdb size.

   Significant temporary space is required for installation and use. The temporary segments need at least 16 MB of available space. Increase the available space as the number of concurrent users increase.

4. Verify the memory allocated to the database server.

   Allocate at least 32 MB of RAM to the database server. The amount of RAM allocated is ideally half of the available RAM on the server.
Transact-SQL Commands

If a graphical DBMS access tool is not available, you can use Transact-SQL commands through ISQL.

Example: Create a device using the Transact-SQL DISK INIT command through ISQL

```sql
DISK INIT NAME = 'mmdata', /* The logical name. */
PHYSNAME = 'C:\SQL\DATA\mmdata.dat', /* The physical name. */
VDEVNO = 1<= virtual_device_number => 255
/* System dependent. */
SIZE = number_of_2K_blocks /* 1024 here is 2MB!!! */
[, VSTART = virtual_address, /* Optional */
CNTRLTYPE = controller_number] /* Optional */
```

Example: Create a database using the Transact-SQL CREATE DATABASE command through ISQL

```sql
CREATE DATABASE mmmaster
[ON {DEFAULT | database_device} [= size_in_megabytes] /* The device created in #1. */
[, database_device [= size_in_megabytes]...] /* A database can span devices. */
[LOG ON database_device [= size_in_megabytes]...] /* Separate log device. */
[, database_device [= size_in_megabytes]...] /* A transaction log can span devices. */
```

Example: Add logins to the database with the sp_addlogin and sp_adduser commands using Transact-SQL through ISQL

```sql
sp_addlogin login_id [, passwd [, defdb [, deflanguage]]]
sp_adduser login_id [, username [, grpname]]
```

After you execute these commands, the DBA can alias an existing login as the Database Owner (dbo) or change the dbo to an existing login using sp_changedbowner. Use ISQL to execute the following:

```sql
sp_changedbowner login_id [true]
```
Install erwin Mart Server

The Mart Server and Mart Admin war files are deployed on a Web server. You can either use an existing web server, or install the web server through the erwin MartServer r9.8 Installation Wizard. You must install erwin Mart Server and configure it regardless of whether you use Mart Server as a Windows service.

**Note:** Ensure that you have reviewed the Install a Mart or Upgrade a Mart topic before proceeding.

1. Do one of the following tasks:
   - Insert the installation DVD and select Mart Server Installation.
   - Download the EDMMS98(32-bit or 64-bit).exe file from the online erwin product page and run it.

   The erwin MartServer r9.8(32-bit or 64-bit) Installation Wizard appears.

2. Go through the wizard steps to install erwin Mart Server.

   Depending on the options you select, erwin Mart Server and/or Java Runtime Environment (JRE) and Tomcat are installed.

   **Note:** If Java (any version) is already available in the computer and the environment variable JRE_HOME is set, the installer overwrites JRE_HOME with the new Java path. The JRE version that is shipped with the installer is 1.8.

3. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8(32-bit or 64-bit), Configure MartServer.

   The erwin Mart Configuration dialog appears.

**Configure the erwin Mart Server**

1. Complete the following fields in the Mart Server tab:

   **Database Type**
   - Specifies the database server type.

   **Port No.**
   - Specifies the port number of the database server.

   **Server Name**
   - Specifies the name of the database server where you have installed the Mart database. For example, suppose that you are using SQL Server as the Mart database. Enter the name of the computer where SQL Server is installed.
**Instance Name**

Specifies the name of the database instance.

**Database Name**

Specifies the name of the Mart database.

**Note:** If you are installing the Mart for the first time, use a new database. Do not use an existing database that was created for r7.3 through r8.2.9 Mart. If you are upgrading the Mart from any earlier release of r9 series to the latest release, use the corresponding Mart database.

**User Name**

Specifies the user name to connect to the Mart database. Enter the name of a user that is authenticated by the Mart database.

**Note:** Windows authentication (User Name field) is not supported for connecting to the Mart database from the Configure Mart Server window.

**Password**

Specifies the password to connect to the Mart database.

**Note:** The following fields--Domain Controller Name, Domain/User Name, and Password are required only if you are using the Active Directory authentication. You can use the Active Directory authentication to initialize the Mart and to log in to erwin Mart Administrator.

**Domain Controller Name**

Specifies the fully qualified name of the Active Directory Server (Domain Controller). Enter the name in the following format:

\[LDAP://server/distinguished-name\]

**Example:** ldap://mktgna:3268/dc=abc, dc=com

Here, mktgna is the server name. You can provide either the name of the server or the IP address. 3268 is the port number to which the server listens.

dc=abc, dc=com is the distinguished-name. The distinguished name is the full path of the object.

**Note:** If you do not know the Domain Controller Name, use the \textit{Nltest} command or talk to your System Administrator.

**Domain/User Name**

Specifies the domain name and user name in the \textit{<domain name>/<user name>} format.

**Password**

Specifies the password of the domain user.
Configure erwin Mart Administrator

1. Enter the following information in the Mart Administrator tab:

   **Server Name**
   Specifies the name of the computer where the Web Server is present. For example, if you are using Tomcat, enter the name of the computer where Tomcat is installed.
   
   **Default:** localhost

   **Port Number**
   Specifies the port number on which the Web Server is running.
   
   **Default:** 18170

   **Application Name**
   Specifies the application name with which the Web Server is identified.
   
   **Default:** MartServer

   **Transport Layer Security**
   Specifies if you want to connect to the Mart through a secured connection (SSL). Select this check box if you have implemented SSL.

   **Hosting Server**
   Specifies that you want to use the IIS web server to connect to the Mart. Select this check box only if you have configured IIS.

   **IIS Port**
   Specify the IIS port number that you want to use. This field is enabled only if you select the Use IIS check box. The default is 80.

   **Account Lockout Duration (Seconds)**
   Specify the duration (in seconds) for which an account should be locked whenever an incorrect password is entered five consecutive times. By default, it is set to five minutes (300 seconds). At the most, you can set it to 30 days (2592000 seconds).

2. Click Configure.

   The erwin Mart Administrator and the Mart Server are configured.

**More information:**

Configure IIS Web Server (see page 150)
Implement SSL for IIS (see page 152)
Enable SSL for Tomcat

SSL enables you to access the Mart through a secured connection. You can enable SSL for Tomcat—the default web server, when you are installing the Mart for the first time.

Follow these steps:

1. If the Mart Server service is running, stop it. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8 (32-bit or 64-bit), Stop MartServer Service to stop the web server.

2. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8 (32-bit or 64-bit), Enable SSL for Tomcat Webserver.

   SSL is enabled for Tomcat and a security certificate is created. You must install this security certificate on all the computers from where you want to access the Mart.

3. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8 (32-bit or 64-bit), Configure MartServer.

   The erwin Mart Configuration dialog appears.

4. Go to the Mart Administrator tab and select the Transport Layer Security check box.

5. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8 (32-bit or 64-bit), Start Mart Server Service.

6. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8 (32-bit or 64-bit), erwin Mart Administrator r9.8 (32-bit or 64-bit).

   The erwin Mart Administrator home page appears and displays HTTPS in the address bar. If a certificate error appears, click Proceed Anyway to begin the session.

   **Important!** If you want to connect to an SSL enabled Mart through API or the Mart Upgrade utility, you must first install the security certificate on the corresponding computer. Install the certificate through the data modeling tool. If you do not install the security certificate, the Mart Upgrade utility and the API will not be able to connect to the SSL enabled Mart.

Disable SSL and Access the Mart Through a Normal Connection

You can disable SSL at any time and access the Mart through a normal connection.

Follow these steps:

1. If the Mart Server Service is running, stop it. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8 (32-bit or 64-bit), Stop Mart Server Service.

2. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8 (32-bit or 64-bit), Disable SSL.

3. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8 (32-bit or 64-bit), Configure MartServer.
The erwin Mart Configuration dialog appears.

4. Go to the Mart Administrator tab and clear the Transport Layer Security check box.

5. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8 (32-bit or 64-bit), Start Mart Server Service.

6. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8 (32-bit or 64-bit), erwin Mart Administrator r9.8 (32-bit or 64-bit).

The erwin Mart Administrator home page appears and displays HTTP in the address bar.

**Use Mart Server as a Windows Service**

The current version of the Mart provides two ways to start the web server that hosts Mart Server:

- Start the web server manually.
- Use a Windows service to start the web server.

For example, if you have used Tomcat as the web server to host Mart Server, you can start Tomcat in two ways:

- Start Tomcat through the startup.bat file or through a shortcut to this file.
- Use a Windows service to start Tomcat.

The benefits of using a Windows service to start a web server are as follows:

- Any user with administrative privileges on a computer can start the Windows service, whereas, only designated users can start a web server manually.
- A Windows service runs regardless of whether a user has logged in. A manually-started web server shuts down when the user who started it logs out.

**Follow these steps:**

1. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8 (32-bit or 64-bit), Create MartServer Service to create the MartServer Windows service.

   Creating the service is a one-time task. After the service is created, you only have to start and stop the service.

2. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8 (32-bit or 64-bit), Start MartServer Service to start the web server.
Initialize a SAP ASE Mart

When you access the Mart database through erwin Mart Administrator for the first time, you must initialize the database. You can initialize the database using a database authenticated user or a Windows authenticated user.

**Note:** Before you proceed, verify that you have installed a DBMS, created the Mart database and run the initial queries. If the Mart is already initialized, the Login page appears.

**Follow these steps:**

1. If you are using MartServer as a Windows service, help ensure that the service is started. If not, from the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8(32-bit or 64-bit), Start Mart Server to start the Mart Server.
   
   A Windows command prompt window appears and indicates when the server starts.

2. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8(32-bit or 64-bit), erwin Mart Administrator r9.8(32-bit or 64-bit).
   
   erwin Mart Administrator opens in your default browser.

3. Complete the following fields:

   **Username**
   
   Defines the user name with which you want to access the Mart. If you are using a Windows-authenticated user, enter the name in the `<domain name>/<user name>` format.

   **Password**
   
   Defines the password for the user name.

   **Note:** A password should fulfill the following criteria:
   - Contains at least 1 lowercase character
   - Contains at least 1 uppercase character
   - Contains at least 1 number
   - Is minimum 6 characters in length
   - Is maximum 130 characters in length
   
   Apart from the above criteria, special characters are optional.
**Confirm Password**

Confirms the password that you entered in the previous field.

**Email Address**

Defines the email address for the user account that you are creating.

4. Click Initialize.

The user name is added as an administrator of Mart, Mart is initialized, and the Login web page appears. Initializing is a one-time task. After Mart is initialized, the user who initialized must log in first. Later, any other user who wants to use erwin Mart Administrator can log in.

**Note:** The user name that is entered here is an application level user and not a database user. Remember the password that you have entered here, because without the password you cannot log in to erwin Mart Administrator for the first time.

In the previous releases, only a server user was allowed to initialize a Mart. From release r9.6, a Windows-authenticated user can also initialize a Mart. Further, a Windows-authenticated user can log in to a Mart as a Windows user.

**To initialize a Mart with a Windows-authenticated user, follow these steps:**

1. Provide the Active Directory details with user credentials in the Active Directory Details section in the erwin Mart Configuration dialog.

2. Open erwin Mart Administrator, enter the user name in the <domain name>/<user name> format. For more information about how to initialize a Mart, see the Workgroup Edition Implementation and Administration Guide.

**To log in as a Windows-authenticated user, follow these steps:**

This procedure describes how to enable a Windows-authenticated user log in to a Mart that is already initialized. Use this procedure if the Mart is initialized with either a server user or a Windows-authenticated user.

1. Ensure that you have provided the Active Directory details with user credentials in the Active Directory Details section in the erwin Mart Configuration dialog.

2. Log in to the Mart as an administrator and add the required user as a Windows user in the Mart. Ensure that the user belongs to the Active Directory that was provided at the time of configuring the Mart.

   Now the Windows-authenticated user can log in to erwin Mart Administrator by providing the user name in the <domain name>/<user name> format.

**Note:** A local Windows user who does not belong to a domain or who is not part of an Active Directory cannot log in to the Mart as a Windows user.
Log In to erwin Mart Administrator and Configure Settings

After the Mart is initialized, the user who initialized must log in first.

Note: If you enter an incorrect password five consecutive times, your account will be locked for five minutes (300 seconds) by default. You can change the time for which the account stays locked as follows:

1. From Windows Start menu, click All Programs, erwin, Mart Server r9.8(32-bit or 64-bit), Configure MartServer.
   The erwin Mart Configuration dialog appears.
2. On the Mart Administrator tab, edit the value of the Account Lockout Duration (Seconds) field to an appropriate value. At the most, you can set it to 30 days (2592000 seconds).

When you log in to Mart for the first time, configure it per the requirements of your organization. You can configure the following settings:

- Default profile for the model creator
- Use default password
- Email notification

Follow these steps:

1. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8(32-bit or 64-bit), erwin Mart Administrator r9.8(32-bit or 64-bit).
   The erwin Mart Administrator home page appears. If you have implemented SSL, HTTPS appears in the address bar.
2. Use the credentials with which you initialized the Mart and log in.
3. Click Settings.
4. Complete the following fields:

   Default profile for model creator

   Specifies the profile that is assigned to a user on a model. This profile is assigned whenever a user creates a model and saves it to Mart for the first time. The user inherits the permissions of the default profile selected here on the model that is saved. For example, suppose that User1 is assigned with Modeler profile and the System Administrator selects Architect as the default profile for model creator. If User1 creates Model1 and saves it to Mart, for Model1, User1 inherits the permissions of Architect. Now, suppose that the System Administrator selects Viewer as the default profile for model creator, and suppose that User1 creates Model2 and saves it to Mart. For Model2, User1 inherits the permissions of Viewer.

Use Default Password
Specifies the default password that you want to use for new users and for resetting passwords, in the absence of an SMTP server for emails.

**Note:** Select this option only if you do not have an SMTP server that is configured for emails.

**SMTP host name**

Specifies the name of the SMTP host. Enter the name in the mail.domain.com format. Notification emails are sent from this server.

**Port number**

Specifies the port number of the SMTP server. The default port number is 25. If your company is using an alternate port number for the mail server, specify that port number.

**Authenticate**

Specifies whether transactions with the SMTP server are authenticated. Select the check box to authenticate.

**User name**

Specifies the user name to authenticate the SMTP server. Select the Authenticate check box to enable authentication.

**Password**

Specifies the password to authenticate the SMTP server. Select the Authenticate check box to enable authentication.

**Administrator email**

Specifies the email ID of the Mart administrator. Notifications to Mart users are sent from this ID.

**No-reply email from**

Specifies the email ID from which administrative emails such as the password reset email are sent.

**Use TLS Connection**

Specifies whether transactions with the SMTP server use a Transport layer Security (TLS). If you intend to use a TLS connection, ensure that the User name and Administrator email correspond to each other.

**Note:** Select this option only if you want to use a TLS connection.

5. Click Save.

Mart options are configured.

You have installed and configured erwin DM Mart.
How to Upgrade any r9 Series Mart to the Current Version

If you are using any earlier release of r9 series and you want to upgrade it to the latest release, upgrade the Mart Server and the Mart database. The Mart server program is upgraded, so you must implement the upgraded software.

**Important!** The current Mart is designed to work with only the current version of erwin® Data Modeler. If you try to connect the current Mart with an older version erwin® Data Modeler such as r9.0.0, it may corrupt the Mart and cause unexpected behavior.

The following diagram illustrates how System Administrators can upgrade a Mart from any earlier release of r9 series to the latest release:

Complete the following tasks to upgrade a Mart of any earlier release of r9 series to the latest release:

1. Review the prerequisites.
2. Upgrade the Mart Server.
3. Configure the Mart Server.
4. Restart the Mart Server service.
5. Log In to erwin Web Admin.
How to Upgrade any r9 Series Mart to the Current Version

Review the Prerequisites

Review the following prerequisites before you start the upgrade process:

If the Mart database is an Oracle database, the default tablespaces that were used for initializing the any earlier release of r9 series Mart are available for the latest release.

Upgrade the Mart Server

If you are upgrading a Mart from any earlier release of r9 series to the latest release, upgrade the Mart Server.

Note: See the Install a Mart or Upgrade a Mart topic before proceeding.

Follow these steps:

1. If you are running MartServer as a Windows service, stop the service and delete it.
   Note: If you upgrade the Mart Server without stopping the service, Mart Server may not start after you complete the upgrade process.

2. Download and run the EDMMS98(32-bit or 64-bit).exe file from the erwin Support site.
   The erwin Mart Server r9.8(32-bit or 64-bit) Install Shield Wizard dialog appears.

3. Follow the wizard.
   The Mart Server is upgraded.

4. Restart your computer.

Configure the Mart Server

To connect to the latest Mart, you must configure the Mart Server. Use the same database that you have used for the r9.0.0 Mart (or any earlier release of r9 series Mart).

Note: See the Upgrade Considerations topic before proceeding.
Follow these steps:

1. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8(32-bit or 64-bit), Configure MartServer.

   The erwin Mart Configuration dialog appears.

**Configure the erwin Mart Server**

1. Complete the following fields in the Mart Server tab:

   **Database Type**
   - Specifies the database server type.

   **Port No.**
   - Specifies the port number of the database server.

   **Server Name**
   - Specifies the name of the database server where you have installed the Mart database. For example, suppose that you are using SQL Server as the Mart database. Enter the name of the computer where SQL Server is installed.

   **Instance Name**
   - Specifies the name of the database instance.

   **Database Name**
   - Specifies the name of the Mart database.

   **Note:** If you are installing the Mart for the first time, use a new database. Do not use an existing database that was created for r7.3 through r8.2.9 Mart. If you are upgrading the Mart from any earlier release of r9 series to the latest release, use the corresponding Mart database.

   **User Name**
   - Specifies the user name to connect to the Mart database. Enter the name of a user that is authenticated by the Mart database.

   **Note:** Windows authentication (User Name field) is not supported for connecting to the Mart database from the Configure Mart Server window.
Password

Specifies the password to connect to the Mart database.

Note: The following fields—Domain Controller Name, Domain/User Name, and Password are required only if you are using the Active Directory authentication. You can use the Active Directory authentication to initialize the Mart and to log in to erwin Mart Administrator.

Domain Controller Name

Specifies the fully qualified name of the Active Directory Server (Domain Controller). Enter the name in the following format:

LDAP://server/distinguished-name

Example: ldap://mktgna:3268/dc=abc, dc=com

Here, mktgna is the server name. You can provide either the name of the server or the IP address. 3268 is the port number to which the server listens. dc=abc, dc=com is the distinguished-name. The distinguished name is the full path of the object.

Note: If you do not know the Domain Controller Name, use the Nltest command or talk to your System Administrator.

Domain/User Name

Specifies the domain name and user name in the <domain name>/<user name> format.

Password

Specifies the password of the domain user.

Configure erwin Mart Administrator

1. Enter the following information in the Mart Administrator tab:

   Server Name

   Specifies the name of the computer where the Web Server is present. For example, if you are using Tomcat, enter the name of the computer where Tomcat is installed.

   Default: localhost

   Port Number

   Specifies the port number on which the Web Server is running.

   Default: 18170
Application Name

Specifies the application name with which the Web Server is identified.

Default: MartServer

Transport Layer Security

Specifies if you want to connect to the Mart through a secured connection (SSL). Select this check box if you have implemented SSL.

Hosting Server

Specifies that you want to use the IIS web server to connect to the Mart. Select this check box only if you have configured IIS.

IIS Port

Specify the IIS port number that you want to use. This field is enabled only if you select the Use IIS check box. The default is 80.

Account Lockout Duration (Seconds)

Specify the duration (in seconds) for which an account should be locked whenever an incorrect password is entered five consecutive times. By default, it is set to five minutes (300 seconds). At the most, you can set it to 30 days (2592000 seconds).

2. Click Configure.

The erwin Mart Administrator and the Mart Server are configured.

Restart the Mart Server Service

When you modify the details of the Mart Server and Mart Administration programs, restart the Mart Server service.

Follow these steps:

1. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8(32-bit or 64-bit), Stop MartServer Service to stop the Mart Server service.

2. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8(32-bit or 64-bit), Start MartServer Service to start the Mart Server service.
Log In to erwin Mart Administrator

Log in to erwin Mart Administrator to verify if you have successfully upgraded the Mart Server from any earlier release of r9 series to the latest release.

Follow these steps:

1. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8(32-bit or 64-bit), erwin Mart Administrator r9.8(32-bit or 64-bit).
   The erwin Mart Administrator log in page appears. If you have implemented SSL, HTTPS appears in the address bar.

2. Use the credentials with which you initialized the Mart and log in.
   The erwin Mart Administrator home page appears.

The models that are created in any earlier release of r9 series are upgraded when a user connects to the latest release Mart and opens the models.
Change the Mart Database Server

Sometimes, you may change the server on which the Mart database is installed, or you may restore the Mart database with a new name. When there is a change the server name or database name, reconfigure the MartServer.

Follow these steps:

1. Back up your Mart database.
2. Restore the database on the designated server.
3. If you use the same computer for Mart Server and restore the database in a different name, include the new database name in the erwin Mart Configuration dialog.

   From the Windows Start menu, open the erwin Mart Configuration dialog. In the Mart Server tab, Database Name field, enter the new name with which the database is restored. Enter the current user name and password to access the database. If wrong information is provided here, you may be able to install the Mart, but you cannot log in and cannot use it.

4. If you use a different computer for Mart Server and restore the database in the same name, install the Mart Server on the new computer.

   Use the Install erwin Mart Server procedure and install the Mart Server. In the Mart Server tab, Server Name field, enter the name of the new server where the database is restored. Enter the current user name and password to access the database. If wrong information is provided here, you may be able to install the Mart, but you cannot log in and cannot use it.

5. Stop the MartServer service and start it again.

6. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8(32-bit or 64-bit), erwin Mart Administrator r9.8(32-bit or 64-bit).

   Enter the credentials of the Mart administrator and log in.

Troubleshooting

This section explains the errors that you can encounter while installing and configuring Mart, and how you can troubleshoot them.

Note: The Mart Server log files are available in the following location:

Windows 7: {user.home}/AppData/Local/erwin Mart Server/logs/application.log
Port out of range

**Symptom:**
Whenever I connect to the web server, I get the following error message:

java.lang.IllegalArgumentException: port out of range 80821.

**Solution:**
Type the correct port number in the Configure erwin Mart Administrator’s Server dialog and then restart your web server.

Call failed on the server

**Symptom:**
When I try to connect to the Mart server, I get the following error:

500 The call failed on the server; see server log for details

**Solution:**
The probable reasons for this error could be one of the following reasons:

- The server name is not correct.
- The application name is not correct. By default, the application name is MartServer and it is case-sensitive.

Type the correct server name and application name in the erwin Mart Administrator’s Server dialog and the Configure MartServer Details dialog. Restart the web server.
Application Internal Error

**Symptom:**
When I try to connect to the database, I get the following error:

**Solution**
You get this error when the MartServer application is unable to connect to the required database. The following reasons are probable for this error:

- The database details that are provided in the Configure MartServer Details dialog are incorrect.
- The username and the password for the database are incorrect.
- The database is not present.
- The port number for the database is incorrect.
- The network is down.

Ensure that you enter the correct details of your database in the Mart Server tab of the erwin Mart Configuration dialog.

ORA-12514 TNS listener does not currently know of service requested in connect descriptor

**Symptom:**
When I try to open the erwin Mart Administrator page, I get the Application Internal Error. The Tomcat windows shows the following error message:

**Solution:**
Use a fully qualified instance name when starting the Mart Server.
Mart already exists. Specify another database name

**Symptom:**
When I try to connect to the Mart, I get the following error message:

An earlier mart is already present in the database you are trying to initialize. This process cannot be continued. Please specify another database name to continue.

**Solution:**
You get this error when you connect to an old Mart that you have used for erwin DM Release r7 series, r8 series, or Beta release of any r9 series release.

Create a database and provide its details in the Configure MartServer Details dialog.

Initialize page is not loading in Internet Explorer

**Symptom:**
When I type the URL to initialize my Mart in Internet Explorer, the Initialize Mart page is taking a long time to load.

**Solution:**
The Initialize Mart page does not load because the Active Scripting option in Internet Explorer is disabled.

**To enable Active Scripting, follow these steps:**
1. In Internet Explorer, click Tools, Internet Options.
2. In the Security tab, click the Custom Level button.
   The Security Settings – Local Intranet Zone window opens.
3. From the list of options, locate Scripting, Active Scripting, and select Enable. Click OK.
4. Restart Internet Explorer and enter the URL to initialize Mart.
   The Mart Initialize page opens.
Troubleshooting

The Tomcat server is not starting properly. The Configure button is disabled.

Symptom:
My administrator has given me the Administrator rights and when I start the Tomcat server, I get a series of errors. Also, I cannot click the Configure button in the configuration dialog because it is disabled.

Solution:
Right-click Start Server, and click Run as Administrator.
The Tomcat server starts without any error, and the configuration button is enabled.

A connection with the server could not be established

Symptom:
When I try to connect to the web server from erwin Data Modeler, I get the following error message:
A connection with the server could not be established

Solution:
Verify that you have provided the correct port number and then reconnect to the web server.

The server name or address could not be resolved

Symptom:
When I try to connect to the web server from erwin Data Modeler, I get the following error message:
The server name or address could not be resolved

Solution:
Verify that the server name where the web server is installed is correct and then reconnect to the server.

Note: If erwin Data Modeler and the web server are installed on the same computer, you can give the server name as localhost. Suppose that erwin® Data Modeler and the web server are installed on different computers. The server name is the name of the computer where the web server is installed.
Invalid user ID or password

**Symptom:**
When I try to connect to the server, I get the following error message:

Invalid user ID or password. Please try again to login.

**Solution:**
Type the correct user name and password.

**Note:** The user must be an application level user and not a database user.

Error 12029

**Symptom:**
When I connect to the web server, I get the following error message:

Error 12029

**Solution:**
Restart the web server.

Unable to load the web page from my web browser

**Symptom:**
When I type the URL in Internet Explorer or Google Chrome to connect to the web server, I get the following error messages:

**For Internet Explorer**
Internet Explorer cannot display the webpage

**For Google Chrome**
Oops! Google Chrome could not connect to localhost:18170

**Solution:**
Restart the web server.
Internet Explorer Redirects to a Different Link

**Symptom:**
Suppose that I install erwin Mart Server on a fresh machine. If I enable the SSL option and I invoke erwin Mart Administrator, Internet Explorer redirects the page to res://ieframe.dll//.

**Solution:**
Internet Explorer versions 8 through 10 have a security enhancement that blocks the following types of sites:
- Sites that have self-signed certificates
- Sites that have self-signed certificates where the certificate does not match the URL

**Follow any of these steps:**
- Install the certificate in the Trusted Root Certification Authorities store.
- Add the site to trusted sites.
- Set the Internet Explorer Security level to Medium Low.
I have a very long Windows user name and I cannot log in to the Mart through erwin Data Modeler

Symptom:
I have added a very long Windows user name similar to "Magdalena.Chalamalasetti" using the Mart Administrator. When the user tries to log in to the Mart through erwin® Data Modeler, the name is truncated to "US\Magdalena.Chalamas" and the user cannot log in.

Solution:
The name is truncated due to a limitation with Windows. The Windows API returns the legacy user name that is limited to 20 characters. If the length of a user name exceeds 20 characters, for example, "US\Magdalena.Chalamalasetti", the name is displayed as "US\Magdalena.Chalamas" in the Connect to Mart dialog.

You can resolve this in one of the following ways:

- Type the first 20 characters of the user name when you add the user as a Windows User, in the Mart Administrator. For example, instead of typing "US\Magdalena.Chalamalasetti", type "US\Magdalena.Chalamas".

- Use a Windows Group instead of the user's domain name. Using your Windows domain controller software, add the user to a Windows Group, and then add the group as a User Group in the Mart Administrator. For more information about how to add a User Group, see erwin Data Modeler r9 Workgroup Edition: Support for Directory Services video.
SAP ASE Mart Database Memory

Symptom:

You may experience one of the following issues when there is insufficient memory for the SAP ASE Mart database.

- You cannot save multiple Mart models in a SAP ASE Mart database.
- When you upgrade a Mart model from 8.x to r9.8 using the upgrade utility for a SAP ASE database the upgrade process fails.

Solution:

Increase the main memory and procedure cache of the database.

1. Enter the following command to increase the main memory of the database:

   ```
   sp_configure "max memory", <memory size>
   <memory size>
   
   Specifies the amount of memory that you need to increase.
   ```

2. Enter the following command to increase the procedure cache of the database:

   ```
   sp_configure "procedure cache size", <memory size>
   <memory size>
   
   Specifies the amount of memory that you need to increase.
   ```

SSL Certificate Error

Symptom:

When you open Mart Administrator from Mart Server that is configured with an SSL certification, an SSL certificate error appears.

Solution:

1. Replace localhost in the Mart Server URL with your computer name.

   ```
   https://localhost:12345/MartAdmin/
   https://<computer_name>:12345/MartAdmin/
   ```

2. Use the updated URL to access the Mart Server
Unable to save a model to Mart with an existing model name

**Symptom:**

When you save a model to Mart with an existing model name, a dialog with the following text appears.

Model '<model name>' already exists in library '<mart name>'. Rename the new model name

**Solution:**

Save the model with a different name.
If you want to use Microsoft Internet Information Services (IIS) as the web server, configure it before deploying Mart Server.

This section contains the following topics:
- Configure IIS Web Server (see page 150)
- Implement SSL for IIS (see page 152)
Configure IIS Web Server

The Mart Server is built using Java technology. Therefore, if you want to connect to Mart through IIS, configure IIS to use the JK ISAPI redirector plugin. Using this plugin, IIS sends servlet and JSP requests to Tomcat.

**Note:** This procedure describes how to configure IIS 6.0 for Microsoft Windows Server® Enterprise 2008. For more information about configuring other versions of IIS for other operating systems, see the respective vendor documentation.

**Follow these steps:**

1. Help ensure that Tomcat is working properly. Open a browser and type the following in the Address bar:

   http://<servername>:18170/MartAdmin

   The default Tomcat home page appears. `<servername>` is the name of the computer where you have installed Tomcat. 18170 is the default port number where Tomcat is running. If you are using a different port number, use that port number here. In addition, help ensure that the port number you are using is included in the server.xml file. Typically, the server.xml file is available in the `<Tomcat_Home>/conf` folder.

2. Install IIS.

   For more information about how to install IIS on Windows Server 2008, see Microsoft documentation.

   **Note:** Unlike IIS 6, for IIS versions 7, 8, and 10, the following Application Development role services are not installed by default:

   - ASP
   - CGI
   - ISAPI Extensions
   - ISAPI Filters

   To select these role services explicitly while configuring IIS:

   b. Click Add Features.
   c. Next, go to Web Server (IIS) > Role Services.
   d. Under Application Development, select ASP, CGI, ISAPI Extensions, and ISAPI Filters check boxes.

3. Create a folder, for example `Native_IIS` on the computer where you have installed IIS. Download the `isapi_redirect.dll` file for Windows from the Apache Tomcat website and copy to `Native_IIS`. If the name of the DLL file is not `isapi_redirect.dll`, rename it.
4. Create the workers.properties, isapi_redirect.properties, uniworkers.properties, uriworkermap.properties, and isapi_redirect.reg files in the Native_IIS folder.

   **Note:** See the Appendix for sample workers.properties, uniworkers.properties, isapi_redirect.reg, isapi_redirect.properties, and uriworkermap.properties files.

5. Create a folder named Logs under Native_IIS. Create two empty files— isapi.log and isapi_redirect.log under Logs.

6. Go to the Native_IIS folder, right-click the isapi_redirect.reg file, and click Merge.

7. Click Yes on the message.

   The registry file is updated.

8. Follow these steps and create an IIS filter for the DLL placed in Step 5:
   a. From the Windows Start menu, click Run, and then type inetmgr.

   The Internet Information Services (IIS) Manager window opens.
   b. Click the computer name and expand Sites.
   c. Right-click Default WebSite and select Add Virtual Directory.

   The Add Virtual Directory dialog appears.
   d. Enter jakarta for Alias. Enter the path for the isapi_redirect.dll file in the Physical Path field and click OK.
   e. Click Default Web Site.
   f. Double-click ISAPI filters and click Add under Action.
   g. Enter Tomcat for Filter name. Enter the path for the isapi_redirect.dll file in the Executables field.
   h. Click OK and the new ISAPI filter is added.
   i. Click Default Web Site and then double-click Handler Mappings.
   j. Click Edit Features and Permissions.

   The Edit Features and Permissions dialog opens.
   k. Select Execute and then click OK.
   l. Click the computer name and then double-click ISAPI and CGI Restrictions.
   m. Click Add under Actions.
   n. Select the path for the isapi_redirect.dll file in the ISAPI or CGI Path field.
   o. Select **Allow extension path to execute** and then click OK.

9. Restart the IIS web server.

10. Stop the MartServer service and start it again.

**Note:** See the Appendix for sample workers.properties, uniworkers.properties, isapi_redirect.reg, isapi_redirect.properties, and uriworkermap.properties files.
Implement SSL for IIS

If you have deployed Mart Server on IIS, you can implement SSL on IIS. SSL lets you access the Mart through a secured connection.

**Note:** This procedure describes how to enable SSL for IIS 6.0. If you are using a different version of IIS, see the relevant document on the Microsoft website for more information about installing IIS.

**Follow these steps:**

1. Open Internet Information Services (IIS) Manager.
2. Double-click Server Certificates and then click Create Self-Signed Certificate.
3. Enter a name for the certificate and click OK.
4. Right-click Default Web Site and click Edit Bindings.
5. Click Add and select https in the Type drop-down menu.
6. Select the certificate name that you have added in the SSL Certificate drop-down menu and click OK.
7. Select Default Web Site and then double-click SSL Settings.
8. Select the Require SSL check box and click Apply.
9. Restart IIS and then restart Tomcat.

**Note:** If the validity of the certificate expires, create another certificate.
Chapter 7: How to Upgrade any r9 Series Mart to the Current Version

If you are using any earlier release of r9 series and you want to upgrade it to the latest release, upgrade the Mart Server and the Mart database. The Mart server program is upgraded, so you must implement the upgraded software.

**Important!** The current Mart is designed to work with only the current version of erwin® Data Modeler. If you try to connect the current Mart with an older version erwin® Data Modeler such as r9.0.0, it may corrupt the Mart and cause unexpected behavior.

The following diagram illustrates how System Administrators can upgrade a Mart from any earlier release of r9 series to the latest release:
Review the Prerequisites

Complete the following tasks to upgrade a Mart of any earlier release of r9 series to the latest release:

1. Review the prerequisites.
2. Upgrade the Mart Server.
3. Configure the Mart Server.
4. Restart the Mart Server service.
5. Log In to erwin Web Admin.

This section contains the following topics

- Review the Prerequisites (see page 154)
- Upgrade the Mart Server (see page 154)
- Configure the Mart Server (see page 155)
- Restart the Mart Server Service (see page 158)
- Log In to erwin Mart Administrator (see page 158)

Review the Prerequisites

Review the following prerequisites before you start the upgrade process:

If the Mart database is an Oracle database, the default tablespaces that were used for initializing the any earlier release of r9 series Mart are available for the latest release.

Upgrade the Mart Server

If you are upgrading a Mart from any earlier release of r9 series to the latest release, upgrade the Mart Server.

Note: See the Install a Mart or Upgrade a Mart topic before proceeding.
Follow these steps:

1. If you are running MartServer as a Windows service, stop the service and delete it.  
   **Note:** If you upgrade the Mart Server without stopping the service, Mart Server may not start after you complete the upgrade process.

2. Download and run the EDMMS98(32-bit or 64-bit).exe file from the erwin Support site.  
   The erwin Mart Server r9.8(32-bit or 64-bit) Install Shield Wizard dialog appears.

3. Follow the wizard.  
   The Mart Server is upgraded.

4. Restart your computer.

**Configure the Mart Server**

To connect to the latest Mart, you must configure the Mart Server. Use the same database that you have used for the r9.0.0 Mart (or any earlier release of r9 series Mart).

**Note:** See the Upgrade Considerations topic before proceeding.

**Follow these steps:**

1. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8(32-bit or 64-bit), Configure MartServer.  
   The erwin Mart Configuration dialog appears.

**Configure the erwin Mart Server**

1. Complete the following fields in the Mart Server tab:

   **Database Type**
   Specifies the database server type.

   **Port No.**
   Specifies the port number of the database server.

   **Server Name**
   Specifies the name of the database server where you have installed the Mart database. For example, suppose that you are using SQL Server as the Mart database. Enter the name of the computer where SQL Server is installed.
Instance Name

Specifies the name of the database instance.

Database Name

Specifies the name of the Mart database.

**Note:** If you are installing the Mart for the first time, use a new database. Do not use an existing database that was created for r7.3 through r8.2.9 Mart. If you are upgrading the Mart from any earlier release of r9 series to the latest release, use the corresponding Mart database.

User Name

Specifies the user name to connect to the Mart database. Enter the name of a user that is authenticated by the Mart database.

**Note:** Windows authentication (User Name field) is not supported for connecting to the Mart database from the Configure Mart Server window.

Password

Specifies the password to connect to the Mart database.

**Note:** The following fields--Domain Controller Name, Domain/User Name, and Password are required only if you are using the Active Directory authentication. You can use the Active Directory authentication to initialize the Mart and to log in to erwin Mart Administrator.

Domain Controller Name

Specifies the fully qualified name of the Active Directory Server (Domain Controller). Enter the name in the following format:

LDAP://server/distinguished-name

**Example:** ldap://mktgna:3268/dc=abc, dc=com

Here, *mktgna* is the server name. You can provide either the name of the server or the IP address. 3268 is the port number to which the server listens.

*dc=abc, dc=com* is the distinguished-name. The distinguished name is the full path of the object.

**Note:** If you do not know the Domain Controller Name, use the *Nltest* command or talk to your System Administrator.

Domain/User Name

Specifies the domain name and user name in the `<domain name>/<user name>` format.

Password

Specifies the password of the domain user.
Configure erwin Mart Administrator

1. Enter the following information in the Mart Administrator tab:

   **Server Name**
   
   Specifies the name of the computer where the Web Server is present. For example, if you are using Tomcat, enter the name of the computer where Tomcat is installed.
   
   **Default:** localhost

   **Port Number**
   
   Specifies the port number on which the Web Server is running.
   
   **Default:** 18170

   **Application Name**
   
   Specifies the application name with which the Web Server is identified.
   
   **Default:** MartServer

   **Transport Layer Security**
   
   Specifies if you want to connect to the Mart through a secured connection (SSL). Select this check box if you have implemented SSL.

   **Hosting Server**
   
   Specifies that you want to use the IIS web server to connect to the Mart. Select this check box only if you have configured IIS.

   **IIS Port**
   
   Specify the IIS port number that you want to use. This field is enabled only if you select the Use IIS check box. The default is 80.

   **Account Lockout Duration (Seconds)**
   
   Specify the duration (in seconds) for which an account should be locked whenever an incorrect password is entered five consecutive times. By default, it is set to five minutes (300 seconds). At the most, you can set it to 30 days (2592000 seconds).

2. Click Configure.

   The erwin Mart Administrator and the Mart Server are configured.
**Restart the Mart Server Service**

When you modify the details of the Mart Server and Mart Administration programs, restart the Mart Server service.

**Follow these steps:**

1. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8(32-bit or 64-bit), Stop MartServer Service to stop the Mart Server service.
2. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8(32-bit or 64-bit), Start MartServer Service to start the Mart Server service.

**Log In to erwin Mart Administrator**

Log in to erwin Mart Administrator to verify if you have successfully upgraded the Mart Server from any earlier release of r9 series to the latest release.

**Follow these steps:**

1. From the Windows Start menu, click All Programs, erwin, erwin Mart Server r9.8(32-bit or 64-bit), erwin Mart Administrator r9.8(32-bit or 64-bit).
   The erwin Mart Administrator log in page appears. If you have implemented SSL, HTTPS appears in the address bar.
2. Use the credentials with which you initialized the Mart and log in.
   The erwin Mart Administrator home page appears.

The models that are created in any earlier release of r9 series are upgraded when a user connects to the latest release Mart and opens the models.
This section contains the following topics

- Adding a User (see page 160)
- Sessions (see page 175)
- Delete Mart (see page 176)
- Catalog Management (see page 176)
Adding a User

As a System Administrator, after installing Mart, you add users, create libraries, and give permissions to users on the required libraries. You know which user should be of what type. You have the details of the profiles you want to create, and you know which profile to assign to which user.

This scenario describes how you can add users to Mart.

The following diagram illustrates how to add a user to Mart:

The following tasks describe how to add a user:
1. Add a user (see page 161).
2. Verify if an existing profile suits the user. (see page 163)
3. Create a profile. (see page 171)
4. Verify if the required catalog or library exists. (see page 172)
5. Create a catalog or library. (see page 172)
6. Assign permissions to the user. (see page 173)
Add a User

As a Mart Administrator, you can add users so that they can access Mart. You delete users if they are not required to access the Mart. You know the type of user you want to add—a user that is authenticated by Mart, a user that is authenticated by the Windows network, or a Windows user group.

Follow these steps:
1. Open erwin Mart Administrator.
2. Click User Management, Add User.
3. Select one of the following options for User Type:
   - **Server User**
     Specifies a Mart user that is authenticated by the credentials provided in Mart.
   - **Windows User**
     Specifies a Mart user that is authenticated by the Windows network.
   - **Group User**
     Specifies a Windows user group. All users that are part of the selected group can access Mart.
4. Enter the user name and email address. Confirm the email address.
   **Note:** The user name field is displayed only for the Server User and Windows User options.
5. Click Save.
   The user account is added and an email is sent to the user.

Mart Users

From r9 onwards, you can add individual users and Active Directory user groups to Mart. Individual users are categorized as Server users and Windows users, which are based on the way they are authenticated. There are no database level users in the current Mart.

The descriptions of user types are as follows:

**Server User**

Specifies the user that is authenticated by the Mart server. The server user is an application level user and not a database user. A server user provides the user name and password to log on to Mart. For example, Peter is a Business Analyst and reviews data models. Add Peter as a Server user as he accesses Mart only at the time of reviewing data models. Peter provides his user name and password to connect to Mart.

**Note:** Only a Server user can access erwin Mart Administrator. There are no database level users in the current Mart.
Adding a User

Windows User

Specifies the user that is authenticated by the Windows network. A Windows user need not provide the user name and password to log on to Mart. For example, Jane is a Data Modeler who works on Mart. Add Jane as a Windows user, so she accesses Mart using her Windows network credentials. Jane does not provide her user name and password to connect to Mart.

User Group

Specifies a user group that is part of an Active Directory. Use this option to add an entire group that accesses Mart. For example, you have a user group ABC-Domain\XYZDivision_AllModelers@MyOrg.com. Add XYZDivision_AllModelers, so that all users that are part of this group and are authenticated by ABC-Domain, connect to Mart. Users of this group do not have to provide their user name and password when they connect to Mart.

Note: A password should fulfill the following criteria:

- Contains at least 1 lowercase character
- Contains at least 1 uppercase character
- Contains at least 1 number
- Is minimum 6 characters in length
- Is maximum 130 characters in length

Apart from the above criteria, special characters are optional.

Also, if you enter an incorrect password five consecutive times, your account will be locked for five minutes (300 seconds) by default. You can change the time for which the account stays locked as follows:

1. From Windows Start menu, click All Programs, erwin, Mart Server r9.8(32-bit or 64-bit), Configure MartServer.
   The erwin Mart Configuration dialog appears.
2. On the Mart Administrator tab, edit the value of the Account Lockout Duration (Seconds) field to an appropriate value. At the most, you can set it to 30 days (2592000 seconds).
Best Practices to Add a Group User

The following are the best practices to add a Group User:

- Suppose that you have a parent group that includes subgroups. To give access to all the subgroups under a parent group, add the parent group as a Group User.

- Suppose that you want to give generic permissions to all users of a parent group and specific permissions to a subgroup. Add both, the parent group and the subgroup and give specific permissions to the subgroup. The permissions given to a subgroup take precedence over the permissions given to a parent group.

- Suppose that you want to give generic permissions to a group and specific permissions to a particular user of the group. Add the group and add the particular user as a Windows user. The permissions given to a Windows user take precedence over the permissions given to a group user.

Verify if an Existing Profile Suits the User

erwin DM Version 9 Mart has four built-in profiles:

- Admin
- Architect
- Modeler
- Viewer

Verify if any of these profiles suit the user you have created. If they do not, create the required profile.

How Profiles Work

The way profiles work depends on the following factors:

- The type of user that is assigned to the profile.
- The objects that are included in the profile.
- The permissions that are assigned to the objects.
This section describes the permissions available for various types of users. The section also includes common user profiles and describes permissions for those profiles.

**Type 1: Mart level**

- Includes items under Catalog Management, Mart, Permission Management, Session Management, and User Management.
- Mart level permissions are granted only if a user is assigned to a profile on Mart.
- The Mart level permissions are restricted or allowed at Mart Server itself. The only exception is that Catalog Manager, Open is handled by the client.

</tr>
</tbody>
</table>
Type 2: Catalog Object level

- Includes items under Library, Model, and Version.
- All library privileges, that is, create, delete, and modify are granted when a user is assigned to a profile on the Library or Mart.
- Catalog Object level permissions are restricted or allowed at Mart Server itself. The only exception is that Model, Modify is also verified in erwin DM as part of live semantic.
Type 3: Modeling Object level

- Includes items under Modeling Object.
- Modeling Object level permissions are used for restricting or allowing create, modify, and delete operations on modeling objects within the Catalog of type Model.
- Modeling Object level permissions are restricted or allowed from live semantic in erwin DM.

Note: To be able to add an entity to the Subject Area and ER Diagram, set the Modify permission for Entity, Subject Area, and ER Diagram for the profile.
Permissions

Permission are defined as follows:

- A profile assigned to a user on a catalog.
- A Catalog could be the Mart, a Library, or a Model.

For more information about the types of users, see the Mart Users (see page 161) topic.
Authorization rules for users

The authorization rules for users are explained with examples for profiles and users. This approach helps you relate to a scenario that exists in your work environment and understand the rules better.

The authorization rules are explained based on the following sample catalog structure:

- Mart
  - Library1
    - Model1
    - Model2
  - Library2
    - Model3
    - Model4

Consider the following sample profiles and users:

- Sample profiles P1 and P2
- Sample Server user SU1
- Sample Active Directory (AD) user ADU1
- Sample AD groups ADG1 and ADG2

Authorization Rules for Server User

- Rule 1: P1 assigned to SU1 on Mart
  - SU1 gets the following privileges:
    - Type 1 privileges of P1 on Mart
    - Type 2 privileges of P1 on all libraries and models
    - Type 3 privileges of P1 on all models in Mart
- Rule 2: P1 and P2 assigned to SU1 on Mart
  - SU1 gets the union of P1 and P2 privileges on the entire Mart. Type 1, 2, and 3 privileges are considered. Union here means that if a privilege is restricted in P1 but allowed in P2, it is allowed for SU1.
  - In this case, multiple profile rule does not apply, as the union of privileges is used.
- Rule 3: P1 assigned to SU1 on Library1
  - SU1 gets the privileges assigned for P1 on the entire Library1.
  - Type 1 privileges are not considered.
- Rule 4: P1 assigned to SU1 on Model1
– SU1 gets the privileges assigned for P1 on Model1.
– Type 1 privileges and some Type 2 (Library) are not considered.

■ Rule 5: P1 assigned to SU1 on Mart and P2 assigned to SU1 on Library1
– SU1 gets the privileges of P1 on Mart and Library2, but not on Library1.
– SU1 gets the privileges of P2 on Library1.

■ Rule 6: P1 assigned to SU1 on Mart and P2 assigned to SU1 on Model1
– SU1 gets the privileges of P1 on Mart, Library1, Model2, and the entire Library2, but not on Model1.
– SU1 gets the privileges of P2 on Model1.

Authorization Rules for Windows User

■ Rule 7:
– If a Windows user is added as a Mart user, the rules of a Server User apply to the Windows user.

Authorization Rules for Group user

■ Rule 8: P1 assigned to ADG1 on Mart, ADU1 is part of ADG1, and ADU1 not added as user on Mart
– ADU1 gets the privileges of P1 on Mart.

■ Rule 9: P1 assigned to ADG1 on Mart, P2 assigned to ADG1 on Library1, ADU1 is part of ADG1, and ADU1 is not added as user on Mart
– ADU1 gets the privileges of P1 on Mart and Library2, but not on Library1.
– ADU1 gets the privileges of P2 on Library1.

■ Rule 10: P1 assigned to ADG1 on Mart, P2 assigned to ADG2 on Mart, ADU1 is part of ADG1 as well as ADG2, and ADU1 is not added as user on Mart
– ADU1 gets the union of P1 and P2 privileges on Mart.

■ Rule 11: P1 assigned to ADG1 on Mart, P2 assigned to ADG2 on Library1, ADU1 is part of ADG1 as well as ADG2, and ADU1 is not added as user on Mart
– ADU1 gets the privileges of P1 on Mart and Library2.
– ADU1 gets the union of P1 and P2 privileges on Library1.

■ Rule 12: P1 assigned to ADG1 on Mart, ADU1 is part of ADG1, and ADU1 is also added as user on Mart
– Since ADU1 is also added as a user on Mart, the user is not considered a part of any group. The rules are same as that of a Windows user.

■ Rule 13: P1 assigned to ADG1 on Mart, P2 assigned to ADG2 on Mart, ADU1 is part of ADG1 only, ADG1 is subgroup of ADG2, and ADU1 is not added as user on Mart
- ADU1 gets the privileges of P1 on Mart. This is because ADG1 is explicitly added on Mart and ADU1 is only part of ADG1.

- Rule 14: P1 assigned to ADG1 on Mart, P2 assigned to ADG2 on Mart, ADU1 is part of ADG1 as well as ADG2, ADG1 is subgroup of ADG2, and ADU1 is not added as user on Mart
  - ADU1 gets the union of P1 and P2 privileges on Mart.
Create a Profile

Profiles determine who can change the data or models in Mart. As a System Administrator, you can create profiles and can attach them to users for a catalog. When a user creates, modifies, or deletes an object in Mart, the profile determines if the operation is permitted. Each profile grants permissions at the following object levels, in the same hierarchical order:

- Catalog Management
- Library
- Mart
- Model
  - Locking
  - Modeling Object
    - Data Movement Rule
    - Data Source Object
    - Default value
    - Domain
    - ER Diagram
    - Entity
    - Relationship
    - Subject Area
    - Theme
    - Validation Rule
    - View
  - User-Defined Property
  - Version
- Permission Management
- Reports
- Session Management
- User Management

**Note:** Admin, Architect, Modeler, and Viewer profiles are created when you install Mart.

**Follow these steps:**

1. Open erwin Mart Administrator.
2. To add a profile, follow these steps:
a. Click Add Profile and enter a name for the profile.

b. Enter a description for the profile.

c. Expand the items in the Permission Details section and select the permissions you want to assign.

Any dependent permissions for the selected permissions are selected too. For example, if you select the Create Entity permission, then Model Modify, ER Diagram Modify, ER Diagram Modify under Subject Area, and Key Group Create permissions are also selected.

d. Click Submit.

The profile is saved.

3. To create a profile from an existing profile, follow these steps:

a. Enter a name for the profile.

b. Select Clone from existing profile and select a profile to clone.

c. Click Submit.

d. Expand the items in the Permission Details section and select the permissions you want to assign.

Any dependent permissions for the selected permissions are selected too. For example, if you select the Create Entity permission, then Model Modify, ER Diagram Modify, ER Diagram Modify under Subject Area, and Key Group Create permissions are also selected.

e. Click Submit.

The profile is saved.

Verify if the Required Library Exists

When you migrate your models to erwin DM Version 9 Mart, you can choose to create libraries and copy models to them. Verify if you can assign these libraries to the user you want to create. If not, create the required libraries.

Create a Library

A library is a collection of related models and a catalog is a group of libraries. Use libraries to add an extra level of security or isolate implementation differences, such as development and production environments.
Follow these steps:
1. Select Mart or an existing library and click New.
   A new library appears with a default name.
2. Change the name per your requirement.
3. Enter a description for the library in the Description field and click Apply.
   A library is created.

Assign Permissions to a User

As a System Administrator, you assign different levels of permissions to different profile users. Control the level of permission and assign a user or a group to a profile so that they have specific access. A user can be assigned to multiple profiles. For example, a user can have full permissions on one library and only view permissions on another.

Follow these steps:
1. Open erwin Mart Administrator.
2. Click Permissions Management, select the libraries that you want the user to access, and select a user or a group.
3. Assign a user or group to a profile and click Submit.
   The profiles is assigned to the user or group.
Examples

This section describes steps to accomplish common business requirements.

Example: Provide permissions to view models in a specific library

Chris, a Business Analyst, has to access Mart to review the models you have copied to the For Review library. Chris only reviews the ER diagrams available in a specific subject area. He may modify the diagrams if required. Chris uses his Windows credentials to log on.

Follow these steps:

1. Add a Windows user named Chris.
2. Create a library named For Review and copy the required model to it.
3. Create a profile named Business Analyst and include the following permissions:
   - Model, Modify
   - Model, Modeling Object, Subject Area, Create and Modify
   - Model, Modeling Object, Subject Area, ER Diagram, Create and Modify
4. Assign the profile to Chris.
   Chris can now log in to Mart using his Windows credentials and review the model.

Example: Set up Mart that allows users save models under a specific library and not under root

You are a System Administrator and you want Jane to create models only under a specific library and not under Mart root.

Follow these steps:

1. Add a Windows user named Jane.
2. Create a library named Projects_Jane.
3. Create a profile named Jane_Profile and include the following permissions:
   - Model, Create
   - Model, Modeling Object, Subject Area, Create and Modify
   - Model, Modeling Object, Subject Area, ER Diagram, Create and Modify
4. Click Permission Management.
6. Click Assign Profile and then click Submit.
   Jane can create models and save them only under the Projects_Jane folder.
Sessions

When you log in to the mart, this event is recorded as the start of a session. During a session, the models that you open and the locks that are applied to each catalog entry are tracked. Each session has its own Action Log, contained in erwin® Data Modeler, which logs the transaction information containing real-time changes that are made to a model. After you have logged out of the mart, the Action Log is cleared and the session is closed.

Session Manager lets you view a session and terminate your sessions. You can also assign the appropriate permission to a user to terminate a session.

To view a session, click File, Mart, Session Manager. The Session Manager dialog lists all the sessions of the current user.

You can also view and delete offline mart models that are saved in a session.

Note: Deleting the offline mart model does not delete the model from the stored location. It deletes the information about that model from erwin® Data Modeler.

To delete an offline mart model, open the Session Manager dialog, and click Offline Mart Models. The Offline Mart Model Manager dialog opens. Select the Catalog item and click Delete offline mart models. The information about the offline mart model is deleted from erwin® Data Modeler.

Terminate Inactive or Closed Sessions

Terminate an Inactive or a Closed session to release all the locks applied in that session. If a session is terminated, then all the information that is related to offline mart models in that session is deleted.

Follow these steps:

1. Click File, Mart, Session Manager.
   The Session Manager dialog opens. It displays all the sessions of a user.

2. Select a session from the Sessions list and click Delete Session.
   The selected session is terminated.
Delete Mart

As a Mart Administrator, you can delete Mart.

**Important!** If you delete Mart, all your libraries, models, and the associated data are deleted permanently.

**Follow these steps:**
1. Open the erwin Mart Administrator and click Delete Mart.
   - A warning message appears.
2. Type YES and click OK.
   - Mart is deleted and the Initialize Mart web page for your database appears.

Catalog Management

The catalog includes libraries, models, and versions of models. Libraries help you organize projects by grouping models together. For example, you can create a library to store models that share a workgroup, a security level, or a target server. Any number of libraries or models can be created and stored in a catalog. By organizing your data models in libraries, you can also easily manage model merging and conflict resolution.

Library Structure Planning

Before you set up your library structure in the Catalog Manager, review how the workgroup modeling process works in your organization. To help you review your workgroup modeling process, answer the following questions:

- How are erwin® Data Modeler models moved from the development library to the production library?
- How are the approval process for moving models documented and enforced?
- How are erwin® Data Modeler models merged into the enterprise model and who controls this process?
- Do you use versioning to record the milestones of models?
- Who has what type of access to each library?
- Are erwin® Data Modeler models generated to multiple target environments (such as Microsoft SQL Server and Oracle)?
- How are you warehousing your data?
Library Structure Organization

During the model development life cycle, you must have an organized library structure. Having an organized library structure helps you move only those models that are intended for production to that level. You can structure your libraries in three distinct types:

**Development Libraries**
Contains models that are being created or updated.

**Test Libraries**
Contains finished models that are being tested before moving them to production.

**Production Libraries**
Contains the finished models that were tested and debugged.

Library Security Levels

After you have created your libraries, determine the security levels for each library. The following examples give you an idea of how you can use libraries and security together to help safeguard models:

- The entire modeling team can have access to the development library and read-only access to the test and production libraries. Authorized project leaders can be assigned to move models from the development library to the test library, and then from the test to the production library.

- Models from other libraries (for example, Sales and Accounting) can be merged from their own libraries in the enterprise model. Modelers working on projects in the Sales or Accounting libraries can have read-only access to the enterprise library and full access to their own projects. Assign one person or group to manage integration to the enterprise model.

- Modelers need full access to their own libraries and read-only access to the libraries of others. This type of security enhances production for the following reasons:
  - Everyone can see what everyone else is working on.
  - All models are stored in one location.
  - Permissions can be changed as different collaborations among modelers become necessary.
Library Structure Considerations

You must consider any or all of these suggestions when building a library structure:

**Practical library names**

Use practical and functional library names that help all users understand the purpose and type of models contained in the library. For example, you can use the format: Short System Name+Version+Stage (for example, Ora_8_Production).

**Model naming and data type standards**

Enforce naming and data type standards, which are vital to efficient workgroup modeling.

*Note:* For more information, see the *erwin® Data Modeler Online Help*.

**Rules for promoting models**

Define a rigid and documented model approval and promotion process using different libraries for each development phase.

**Rules for versioning models**

Define versioning rules using different libraries for each development version (for example, Development Beta 1).

**User rights and security**

Apply stricter rights to libraries that contain mature models nearing the latter stages of development. You can also apply strict rights to individual models.

**Publication**

Generate reports to communicate milestones in the model development process.

**Schema generation rules**

Set up a library where you generate the model schema. Usually, you generate the model schema of promoted models only in the latter stages of development.
Manage Catalogs

A catalog is similar to a directory structure. It consists of libraries, data models, model versions, and templates. Catalog Management displays a hierarchical tree of Mart and lets you manage your catalogs. It has all the features included in the Library Manager and Session Manager modules that were available in the previous releases of erwin® Data Modeler Workgroup Edition.

Following are some of the features in Catalog Management:

**Libraries**

Use libraries to group related models. Libraries add an extra level of security or isolate implementation differences, such as development and production environments. A library can be part of another library or can be present under the Mart.

**Sorting**

In a catalog, the libraries are sorted alphabetically, and the models within the libraries are also sorted alphabetically. Versions are sorted newest to oldest; Named Versions appear first, and then Delta Versions follow. The catalog entries sort in the following order: Libraries, Models, Templates, and Versions respectively.

**Context Menu**

The context menu appears when you select a catalog entry and right-click. You can use the context menu to cut, copy, paste, and delete a library, model, or template. You can also use the context menu to mark a Delta version and delete, hide, and unhide Named and Delta versions.

You can create, delete, copy, and move catalog entries; you can hide and unhide versions.

**Follow these steps:**

1. Open erwin Mart Administrator and select the Catalog Management panel.
2. To create a library, follow these steps:
   1. Click Create Library.
      A library is created.
   2. In the Edit Catalog section, edit Name and Description fields and click Submit.
      The name and description are updated.
3. To create a Named version, follow these steps:
   1. Select either a Named version or a Delta version of a data model and click Mark Version.
      A Named version is created.
2. In the Edit Catalog section, edit the name and description fields and click Submit.
   The name and description of the Named version is updated.

4. To hide a model version, select the version from the Catalog pane, and click Hide Version.

5. To unhide a model version, select the model of that version, click Unhide Version. From the Hidden versions dialog, select your version and click OK.

6. To delete a catalog entry, select the entry and click delete.
   The Delete button is disabled when the last existing version of a model, or all the versions of a model are selected. The catalog entry is permanently deleted from Mart and it cannot be recovered.
Lock a Catalog Entry

You can lock any catalog entry, even mart, to restrict other users from editing it. You can view the current lock status of a catalog entry in the Locks section. Locks last until the duration of a session or until removed. Locks can last even after a session is disconnected; it means that the user is disconnected from Mart but the lock is still preserved. You can work offline on a model without losing the lock. Only the Administrator can override any lock.

The following lock options are available in Mart:

**Existence Lock**
Prevents other users from deleting a catalog entry. When you have an Existence lock, other users can read and update, but not delete the catalog entry. You can edit or move the catalog entry but cannot delete the entry. The presence of an Existence Lock prevents anyone, other than the lock owner, from acquiring an Exclusive Lock on the entry. You can apply Existence Lock, Shared Lock, or Update Lock, with the existing Existence Lock, to the catalog entry.

**Shared Lock**
Prevents other users from editing the catalog entry. When a you have a Shared lock, other users can read, but cannot update or delete the catalog entry. You can open a model with Shared Lock in read-only mode; you cannot edit the model. The presence of a Shared Lock prevents anyone from acquiring Update Lock or an Exclusive Lock on the entry. You can apply Existence Lock with Shared Lock to a catalog entry.

**Update Lock**
Lets only the lock holder to edit the catalog entry. When you have an Update lock, other users cannot read, update, or delete the catalog entry. The presence of Update Lock on an entry prevents other users from acquiring any other locks, except Existence Lock.

**Exclusive Lock**
Lets only the lock holder to edit a catalog entry. When you have an Exclusive lock, other users cannot read, update, or delete the catalog entry. In addition, no other user can add any type of lock on the entry.

**Unlock Entry**
Lets only the lock holder to unlock an entry.

Depending on the type of lock, you can move any entry in the catalog. Acquire Update Lock on a catalog entry before you move that entry.

You cannot move or copy a catalog entry if any of the following conditions is true:

- the entry has any lock other than Existence Lock or Shared Lock
- the parent of that entry has any lock, other than Existence Lock
Lock Behavior

When you edit a catalog entry, locks are applied automatically to appropriate levels in the catalog to prevent other users from editing the entry. When the edit is complete, the locks are removed or downgraded automatically.

The following scenarios apply to locks when you edit a catalog entry:

- When you load a model, Shared Lock is applied to the model and Existence Lock is applied to the parent entry up to the mart. After the model is loaded, Shared Lock is replaced with Existence Lock.
- When you initially save a model, Update Lock is applied to the model automatically. After the model is saved, Update Lock is replaced with Existence Lock automatically. If you apply the Update Lock manually, the lock is retained until you release it manually, or until the model is closed.
- When you incrementally save a model, Update Lock is applied to all the versions created between the opened version and the newly created version. After the model is saved, Update Lock is replaced with Existence Lock.
- When you delete a model, Exclusive Lock is applied to the model. After the model is deleted, the lock is dropped.
- When you delete a user, all the locks that the user had applied are deleted.
- When you rename a library, Update Lock is applied to the library. After the library is renamed, the lock is removed.
- When you load models for version compare, Shared Lock is applied to the root model. After the model is loaded, Shared Lock is removed.
- When you merge or import objects during version compare, Update Lock is applied to the root model. When the merge or import is complete, Update Lock is removed.
Chapter 9: Workgroup Modeling Reports

Modelers typically work from a common set of libraries and models, and share information about these objects with other users. One way to share information is by using reports, which details the information and definitions for a model. You can generate predefined reports to view the contents of specific libraries and models, view the changes and conflicts for specific models, and view the security structure for the database.

You can generate Mart reports using either the Report Designer or a third-party reporting tool. This section describes the reports that are generated using Crystal Reports.

**Report Designer**

Report Designer lets you create a wide variety of Mart administrative reports and cross-model reports. You can create report templates for frequently used reports and you can export reports to the HTML, CSV, and PDF formats. You can create report solutions and include multiple report templates. For more information about the Report Designer, see the Online Help.

**Reporting Tool**

You can create custom reports using a third-party reporting tool. For more information about generating custom reports, see the Creating Custom Mart Reports using a Reporting Tool guide.

erwin® Data Modeler Workgroup Edition includes the following predefined reports:

**Global Reports**

The following table describes the global reports that you can run against Mart:

<table>
<thead>
<tr>
<th>Report Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attributes By Name</td>
<td>Provides information for a specified attribute name—logical and physical, including its library, and its owning diagrams and entities.</td>
</tr>
<tr>
<td>Derived Models</td>
<td>Provides a list of all models that are created using the Derive Model process.</td>
</tr>
<tr>
<td>Entities by Name</td>
<td>Provides information for a specified entity name—logical and physical, including library, its owning diagrams, and owned attributes or columns.</td>
</tr>
<tr>
<td>Libraries</td>
<td>Provides a list of all libraries in Mart.</td>
</tr>
<tr>
<td>Library Model Entity</td>
<td>Provides a hierarchical list of all entities in models and libraries.</td>
</tr>
<tr>
<td>Report Name</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>Library Model Version</td>
<td>Provides a list of the versions of all models.</td>
</tr>
<tr>
<td>Library Model</td>
<td>Provides a list of the models in the selected libraries.</td>
</tr>
<tr>
<td>Mart Domains</td>
<td>Provides a list of all domains used by diagrams, sorted by diagram and library. Includes the domain name, domain parent, domain parent name, and domain data type.</td>
</tr>
<tr>
<td>Models with Subject Areas</td>
<td>Provides a list of all Subject Areas and the diagrams in each Subject Area in a model.</td>
</tr>
<tr>
<td>Models</td>
<td>Provides a list of all the models in the entire Mart. The report includes details such as the number of entities and attributes, and the total number of model objects.</td>
</tr>
<tr>
<td>Subject Areas</td>
<td>Provides the list of all subject areas, including subject area members.</td>
</tr>
<tr>
<td>User Defined Properties</td>
<td>Provides a list of all user-defined properties for the current open model, including UDP name, class name, and default value.</td>
</tr>
<tr>
<td>Users</td>
<td>Provides a list of all users assigned to Mart, including user numeric ID and server login.</td>
</tr>
</tbody>
</table>

**Model Validation Reports**

The following table describes the model validation reports that can be run against models in the mart:

<table>
<thead>
<tr>
<th>Report Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attributes without Definition</td>
<td>Provides a list of all attributes that have no definition text for the specified model.</td>
</tr>
<tr>
<td>Attributes without Domains</td>
<td>Provides a list of all attributes that have no domain association for the specified model.</td>
</tr>
<tr>
<td>Entities whose Primary Keys are all Foreign Keys</td>
<td>Provides a list of entities in all the models that have foreign keys as their primary keys.</td>
</tr>
<tr>
<td>Entities without Definitions</td>
<td>Provides a list of all entities that have no definition text for the specified model.</td>
</tr>
<tr>
<td>Entities without Primary Keys</td>
<td>Provides a list of all entities that have no primary key for the specified model.</td>
</tr>
<tr>
<td>Many to Many Relationships</td>
<td>Provides the details of many-to-many relationships available in all the models in the Mart.</td>
</tr>
<tr>
<td>Model Attributes without Definition</td>
<td>Provides a list of all attributes that have no definition for the specified model.</td>
</tr>
</tbody>
</table>
### Catalog Management

#### Chapter 9: Workgroup Modeling Reports

<table>
<thead>
<tr>
<th>Report Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unattached Entities</td>
<td>Provides a list of entities that are not the parent of a relationship. The report includes information for all the models in Mart.</td>
</tr>
</tbody>
</table>

#### Diagram Reports

The following table describes the reports that can be run against diagrams:

<table>
<thead>
<tr>
<th>Report Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Definitions</td>
<td>Provides the definition information of the specified diagram.</td>
</tr>
<tr>
<td>Domains</td>
<td>Provides the domain usage of the specified diagram.</td>
</tr>
<tr>
<td>Entities</td>
<td>Provides the entity information for the specified diagram.</td>
</tr>
<tr>
<td>Entity Attributes</td>
<td>Provides the details of all the entities and their attributes in the selected model.</td>
</tr>
<tr>
<td>Entity PK FK</td>
<td>Provides the details of primary and foreign keys for all the entities in the selected model.</td>
</tr>
<tr>
<td>Entity Subtypes</td>
<td>Provides the details of all the entity subtypes for the selected model.</td>
</tr>
<tr>
<td>Entity Supertypes</td>
<td>Provides the details of all the entity supertypes for the selected model.</td>
</tr>
<tr>
<td>Entity Table Attribute Column Datatype Nulls</td>
<td>Provides a list of all data type null values for entity attributes and table columns for the selected model.</td>
</tr>
<tr>
<td>Model Subject Areas</td>
<td>Provides a list of the Subject Areas and their members for the selected model.</td>
</tr>
<tr>
<td>Index Members</td>
<td>Provides a list of the index member usage for the specified diagram.</td>
</tr>
<tr>
<td>Index Properties</td>
<td>Provides the index properties for all objects in use for the specified diagram.</td>
</tr>
<tr>
<td>Relationships</td>
<td>Provides a list of relationship usage for the specified diagram.</td>
</tr>
</tbody>
</table>
Model Locks Report

Provides information about the lock status of all models in the selected library.

View and manage report results in the erwin Reports Viewer. Use the predefined reports available on the Tools menu, use either the Bulk Editor to view and edit object properties in the current model and export results to a CSV file, or use the Query Tool to execute predefined or customized SQL SELECT statements against a model.

Model Contents by Class

The Model Contents by Class report includes erwin objects available in the selected model based on their class.

Bulk Editor

The Bulk Editor provides the selection, validation, and maintenance of model object metadata, permits reusable customization (option sets), and realtime access to model changes. Export results or selected rows to a CSV file. You can use the Bulk Editor to edit a small set of properties over a large number of objects. Changes and updates are immediately committed as you make them, field by field.

Query Tool

The Query Tool is used to query the repository through executing SQL SELECT statements against a local model or a model in the mart. You can use the Query Tool to create your own .QRY report file. Save your option set locally to the model or as an XML file. Export your results to a CSV file. You can execute a query against the objects and properties in the model, the metadata defining those objects and properties, and the action log that records the changes that are made to your model during the modeling session. You can create new queries or paste text from another source (such as a .SQL file) into a query. Although the Query Tool provides a built-in query interface in erwin Data Modeler, you can also use any third-party reporting tool that has ODBC capability to query erwin Data Modeler modeling data.

This section contains the following topics

Generate a Global Report (see page 187)
Generate a Model Validation Report (see page 189)
Generate a Diagram Report (see page 191)
Generate a Model Lock Report (see page 192)
Generate a Report on Model Contents by Class (see page 193)
The Report Viewer (see page 194)
Generate a Global Report

Global reports provide information about Mart including its libraries, models, model objects, and diagrams. To run the Global Reports, you must have Mart level permissions.

Note: Connect to Mart to view the available reports and to generate a global report.

Follow these steps:

1. Click Tools, Mart Reports, Global Reports, then select one of the following reports:

   - **Attributes By Name**
     Provides information for a specified attribute name—logical and physical, including its library, and its owning diagrams and entities.

   - **Derived Models**
     Provides a list of all models that are created using the Derive Model process.

   - **Entities by Name**
     Provides information for a specified entity name—logical and physical, including library, its owning diagrams, and owned attributes or columns.

   - **Libraries**
     Provides a list of all libraries in the mart.

   - **Library Model Entity**
     Provides a hierarchical list of all entities in models and libraries.

   - **Library Model Version**
     Provides a list of the versions of all models.

   - **Library Model**
     Provides a list of the models in the selected libraries.

   - **Mart Domains**
     Provides a list of all domains used by diagrams, sorted by diagram and library. Includes the domain name, domain parent, domain parent name, and domain data type.

   - **Models with Subject Areas**
     Provides a list of all Subject Areas and the diagrams in each Subject Area in a model.
Models

Provides a list of all the models in the entire Mart. The report includes details such as the number of entities and attributes, and the total number of model objects.

Subject Areas

Provides the list of all subject areas, including subject area members.

User Defined Properties

Provides a list of all user-defined properties for the current open model, including UDP name, class name, and default value.

Users

Provides a list of all users assigned to Mart, including user numeric ID and server login.

The Database Login dialog opens.

2. Enter login information and click Connect.

Depending on the report requested, either the generated report opens in the viewer or you are prompted to enter additional parameters for the report. Once these parameters are entered, the report opens.

The report is generated and opens in the viewer.

3. Use the toolbar options to export or print the report.

4. Click Exit on the File menu.

The Report Viewer closes.
Generate a Model Validation Report

Run a model validation report to validate your model to ensure complete and accurate model information. To run the Model Validation Reports, you must have Mart level permissions.

**Note:** Connect to Mart to generate a model validation report.

**Follow these steps:**

1. Click Tools, Mart Reports, Model Validation Reports, then select one of the following reports:

   **Attributes without Definition**
   Provides a list of attributes that have no definition text in all the models in the Mart.

   **Attributes without Domains**
   Provides a list of attributes that are not owned by any domains in all the models in the Mart.

   **Entities whose Primary Keys are all Foreign Keys**
   Provides a list of entities in all the models that have foreign keys as their primary keys.

   **Entities without Definitions**
   Provides a list of entities that have no definition text in all the models in the Mart.

   **Entities without Primary Keys**
   Provides a list of all entities that have no primary key in all the models in the Mart.

   **Many to Many Relationships**
   Provides the details of many-to-many relationships available in all the models in the Mart.

   **Model Attributes without Definitions**
   Provides a list of all attributes that have no definition in all the models in the Mart.

   **Unattached Entities**
   Provides a list of entities that are not the parent of a relationship. The report includes information for all the models in Mart.

The Database Login dialog opens.
2. Enter login information and click Connect.
   Depending on the report requested, either the generated report opens in the viewer or you are prompted to enter additional parameters for the report. Once these parameters are entered, the report opens.
   The report is generated and opens in the viewer.
3. Use the toolbar options to export or print the report.
4. Click Exit on the File menu.
   The Report Viewer closes.
Generate a Diagram Report

Diagram reports provide information about the current diagram open in the mart. To run the Model Validation Reports, you must have Mart level permissions.

Note: Connect to Mart to view the available reports and to generate a diagram report.

Follow these steps:

1. Click Tools, Mart Reports, Diagram Reports, then select one of the following reports:
   - **Definitions**: Provides the definition information of the specified diagram.
   - **Domains**: Provides the domain usage of the specified diagram.
   - **Entities**: Provides the entity information for the specified diagram.
   - **Entity Attributes**: Provides the details of all the entities and their attributes in the selected model.
   - **Entity PK FK**: Provides the details of primary and foreign keys for all the entities in the selected model.
   - **Entity Subtypes**: Provides the details of all the entity subtypes for the selected model.
   - **Entity Supertypes**: Provides the details of all the entity supertypes for the selected model.
   - **Entity Table Attribute Column Datatype Nulls**: Provides a list of all data type null values for entity attributes and table columns for the selected model.
   - **Model Subject Areas**: Provides a list of the Subject Areas and their members for the selected model.
   - **Index Members**: Provides a list of the index member usage for the specified diagram.
   - **Index Properties**: Provides the index properties for all objects in use for the specified diagram.
   - **Relationships**
Generate a Model Lock Report

Provides a list of relationship usage for the specified diagram.

The Database Login dialog opens.

2. Enter login information and click Connect.

Depending on the report requested, either the generated report opens in the viewer or you are prompted to enter additional parameters for the report. Once these parameters are entered, the report opens.

The report is generated and opens in the viewer.

3. Use the toolbar options to export or print the report.

4. Click Exit on the File menu.

The Report Viewer closes.

Generate a Model Lock Report

The Model Lock report provides information about the lock status of all the models in a library.

Note: Connect to Mart to view the available reports and to generate a model lock report.

Follow these steps:

1. Click Tools, Mart Reports, Other, Model Lock.

   The Database Login dialog opens.

2. Enter login information and click Connect.

3. Enter additional parameters for the report.

   The report is generated and opened in the viewer.

4. Use the toolbar options to export or print the report.

5. Click Exit on the File menu.

   The Report Viewer closes.
Generate a Report on Model Contents by Class

The Model Contents by Class report includes erwin objects available in the selected model based on their class.

**Note:** Connect to Mart to view the available reports and to generate a class-wise content report.

**Follow these steps:**
1. Click Tools, Mart Reports, Other, Model Contents by Class.
   The Database Login dialog opens.
2. Enter login information and click Connect.
3. Enter additional parameters for the report.
   The report is generated and opened in the viewer.
4. Use the toolbar options to export or print the report.
5. Click Exit on the File menu.
   The Report Viewer closes.
The Report Viewer

The Report Viewer lets you view reports created using a reporting tool. For example, Crystal Reports. It opens when you select a report to generate on the Tools menu. It provides a way to view the report you selected to run, and work with options for exporting and printing the report.

Use the following features to work with the Report Viewer:

Export Report

Specifies to export the report to a folder you specify. After it is exported, you can share the report with others. The default format is as a Crystal Reports report (.rpt), but you can specify one of the following additional formats:

- Adobe PDF (.pdf)
- Microsoft Excel (97-2003) (.xls)
- Microsoft Excel (97-2003) Data-Only (.xls)
- Microsoft Word (97-2003) (.doc)
- Microsoft Word (97-2003) - Editable (.rtf)
- Rich Text Format (.rtf)
- XML (.xml)

Print Report

Specifies to print the report.

Refresh

Specifies to refresh the information in the report.

Toggle Parameter Panel

Lets you toggle the display of the parameter panel. The panel shows the input parameters as provided to generate the report. If the report contains no parameters, the view is empty.

Toggle Group Tree

Lets you toggle the display of the tree hierarchy of the objects on which you generated the report.

Go to First Page

Goes to the first page of the report.

Go to Previous Page

Goes to the previous page of the report.

Go to Next Page

Goes to the next page of the report.
Go to Last Page
Goes to the last page of the report.

Find Text
Opens a Find dialog so you can enter a text string to search within the report.

Zoom
Lets you specify the magnification of the report text.
Chapter 10: Create Reports Using Report Designer

Report Designer lets you create a wide variety of reports and on the current data available in your data models. If you are working in the Workgroup Edition, you can create Mart administrative reports and cross-model reports. You can create report templates for frequently used reports and you can export reports to HTML, CSV, and PDF formats. You can create report solutions and include multiple report templates.

You cannot reuse the .RTB reports that were created using Report Template Builder, because the metamodel objects are changed. You must recreate the reports in Report Designer.

Several sample (pinned) reports are included with the application and they are available in the following location:

%Installdir%\erwin\Data Modeler r9\BackupFiles\Report Solutions

Also at the following location:

Windows 7

C:\Users\<user name>\AppData\Local\erwin\Data Modeler\9.8\Report Solutions

Note: The pinned reports are created using a Logical-Physical model. If you use the pinned reports with a Logical-only or a Physical-only model, it may result in inappropriate results.

Follow these steps:

2. To create a report solution, click Create new solution for reports on the toolbar.
   If the current report solution is not saved already, you are prompted to save it. A new blank workspace appears.
3. To create a report template, follow these steps:
   a. Click Create a Report on the toolbar. The Report Editor dialog appears.
   b. Enter a name for the report.
   c. Select the model type that you want to report on. Select Mart to create a report on the Mart data.
      The items in the Select Report Subject pane change according to the Report Type that you select.
      Note: You must have the Reports: View permission to create Mart reports.
d. In the Select Report Subject pane, select the item on which you want to generate the report.

e. In the Select Report Fields pane, select the fields that you want to include in the report.

f. To include a specific set of objects in the report, use the Filter by option. This option is available only for entities, tables, attributes, columns, subject areas, and indexes.

g. Click Run Report.
   If you are creating a report on your Mart and you have selected an option under Filter By, the Mart Report Filter dialog opens.

h. Select the specific models that you want to get the results from. Enter the specific model object name. Use wildcard characters, if necessary.
   The report is generated and displayed. If you do not specify any model or entity, the generated report includes all the models. If you have used a wildcard, by default, the wildcard is applied to all the names. For example, if you type ID, the report includes Cust_ID and ID_For_Category. If the result is very large for Mart reports, the report is displayed in multiple pages (data grid). Use the navigational icons in the toolbar to view the subsequent pages.

i. (Optional) Click the Clear data in data grid icon to clear the results in the grid.

4. To configure report preferences, follow these steps:
   a. Click Edit, Preferences. The Report Designer Preferences dialog appears.
   b. Complete the following fields and click OK:

   **Add object type as prefix for the properties 'Name' and 'Physical Name'**
   Prefixes the object type to only the Name and Physical Name columns. For example, you are generating a report on entities and the corresponding attribute names and data types. The column names in the report are displayed as Entity Name, Attribute Name, and Attribute Logical Data Type.
Add object type as prefix for all other properties

Prefixes the object type to all columns.

**Note:** These options work only when they are selected at the time of creating a report. If these options are selected at the time of modifying an existing report, they do not work.

Apply optimization mode if row count is more than

Specifies the number of rows at which the computer resources are optimized to display the report. If the row count in your report exceeds the number that you specify here, the report is displayed in optimization mode. In this mode, the group and sort options are not available in the result grid. If no value is entered, the row count for optimization mode is considered as equal to the total row count of a report.

Number of top rows to display

Specifies the number of top rows that you want to display. This option displays the first few rows that match a report criteria, when the result contains more rows than the number specified here.

5. To generate a report from an existing report template, select the template, right-click, and click Run.

6. To modify an existing report template, select the template, right-click and then click Properties. After you finish modifying, click Run Report.

**Note:** When you modify an existing report template and select more properties for the existing report subject, the selections are retained. If you select a different report subject, the previous report subject and its properties are not included in the report.

7. To customize the appearance of the report at the node-level, follow these steps:
   a. Right-click the node and click Properties. Complete the following fields:

      Name

      Specifies the name of the node. By default the name of the selected object is displayed.

      HTML Style

      **Note:** These settings apply to both HTML and PDF reports.

      Font Family: Specifies the font for the selected node.

      Size: Specifies the font size for the selected node.
PDF Page Breaking: Specifies that you want to display the details of each node on a new page. The node for which this option is selected and the subsequent nodes are displayed on a new page. This option is not effective when the report has only one node. When the report has multiple nodes, do not set this option on the main node. Suppose your report nodes look like the following illustration:

![Diagram of Report Nodes]

If you apply the PDF Page Breaking option to the Child Relationship (above CR Physical Name) node, the CR Physical Name and Column Physical Name nodes are displayed on a new page.

Foreground: Specifies the text color.

Background: Specifies the background color.

Template Color: Specifies that the color that is specified in the template is used.

Bold/Italic/Underline/Strikeout: Specifies the effect for the text.

Width: Specifies the width of the selected node (report column). You can specify the width for any node and it is applied when the report is exported to HTML or PDF. However, the width is not applied to the last node (last column in the report) in a PDF report. This is because, the remaining length of the fixed page width is considered as the actual width of the column.

Alignment: Specifies the alignment of the text.

8. To export a report solution to HTML, follow these steps:

   - Right-click the report solution and click Export All to HTML. The Report Export dialog appears.
   - Click Browse and select the folder to which you want to export the report.
   - Go to the HTML tab and add the title in the Solution Title in HTML field.
   - Click OK. The report is generated in the specified folder.
9. To export a report to HTML, follow these steps:
   a. Click the Clear data in data grid icon and clear the result grid.
      This is a best practice and helps the application export the report without consuming much of the computer resources.
   b. Right-click the report and click Export to HTML. The Report Export dialog appears.
   c. Click Browse and select the folder to which you want to export the report.
   d. Go to the HTML tab and complete the following fields:
      **Select the template for exporting to HTML**
      Specifies the templates that you want to use with the HTML report. You can use customized templates, provided the formatting is similar to the default templates. The default templates are available in the following folder:
      C:\Program Files\erwin\Data Modeler r9\Report\Template\Template-Default
      **Solution Title in HTML**
      Specifies the title for the entire report solution.
      **Report Header in HTML**
      Specifies the text that appears between the report title and the first line of the report.
      **Report Footer in HTML**
      Specifies the text that appears at the bottom of the report.
   e. Click OK. The report is generated in the specified folder. If the report data spans multiple page grids in the Report Designer, the data is segregated into multiple sections in the HTML. The sections are first divided by model name and then by object name. This means that a section may include objects from different models, which are sorted by model name and object name.

10. To view the HTML report on a different computer, include the computer name in the path to the filename. For example, if you have published the report to c:\erwin\reports folder on a computer that is named Comp001, use the following path to access it:
    \comp001\erwin\reports\index.htm

    **Note:** The computer from which you are accessing the report must be in the same domain as the one in which the report is published. In addition, the user who is accessing the report must have at least the read-only privileges on the corresponding folder.
11. To export a report or a report solution to CSV, follow these steps:

   a. Right-click the report and click Export to CSV. Or, right-click the report solution and click Export All to CSV. The Report Export dialog appears.

   b. Click Browse and select the folder to which you want to export the report.

   c. Go to the TEXT tab and select the following options:

      Format

      Specifies whether you want to include the first-level object names multiple times. For example, you have included entity names and attribute names in your report and you have selected No Duplicates. The entity name appears only once for all the corresponding attribute names. If you have selected Duplicates, the entity name appears as many times as the corresponding attribute names appear.

      Text Qualifier

      Specifies the symbol that you want to use to indicate the column headers.

      Delimiters

      Specifies how you want to separate two columns in the exported report. The option Comma Delimited creates a .CSV file and the remaining options create .TXT files.

   d. Click OK. The report is generated in the specified folder.
12. To export a report to PDF, follow these steps:
   a. Click the Clear data in data grid icon and clear the result grid. This is a best practice and helps the application export the report without consuming much of the computer resources.
   b. Right-click the report and click Export to PDF. The Report Export dialog appears.
   c. Click Browse and select the folder to which you want to export the report.
   d. Go to the PDF tab and complete the following fields:
      - **Solution Title in PDF**: Specifies the title for the entire report solution.
      - **Report Header in PDF**: Specifies the text that appears on the first line of every page of the report.
      - **Report Footer in PDF**: Specifies the text that appears at the bottom of every page of the report.
      For each of these options, you can specify the font, size, color, and alignment.
      - **Image Orientation**: Specifies the direction of the images that are generated in the report. Images are generated for the Subject Area and ER Diagram reports, when you select properties under Graphical Members.
   e. Click OK. The report is generated in the specified folder. If the report data spans multiple page grids in the Report Designer, the data is segregated into multiple sections in the PDF. The sections are first divided by model name and then by object name. This means that a section may include objects from different models, which are sorted by model name and object name.

13. To add a report from another report solution, follow these steps:
   [a. In the Report Designer dialog, right-click the template name and click Add Report.]
   [b. Select the report that you want to include (.erpt file) and click OK.]
   [c. Save the report solution.]

This section contains the following topics:
- [Mart-Level Reports in Report Designer](#) (see page 204)
- [Cross-Model Reports](#) (see page 204)
- [Mart Model Reporting Status](#) (see page 205)
- [Schedule Mart Report Synchronization](#) (see page 206)
- [Use Multiple Threads to Update Mart Models for Reporting](#) (see page 208)
- [Mart Report Data Compression](#) (see page 209)
Mart-Level Reports in Report Designer

You can now generate reports on the Mart. The reports that you generate could be administrative or about the model objects. For example, you can generate a report on the profiles that are attached to users, or on the list of entities without primary keys. When you generate the report, you can use the filter to search within specific objects. The filter supports SQL wildcard characters such as ? and %.

**Note:** You must have the Reports: View permission to create Mart reports.

**Follow these steps:**

1. Open erwin® Data Modeler and log in to the Mart.
2. Click Tools, Report Designer.
3. Enter a name for the report and click Mart.
4. Select the report subject in the Select Report Subject pane.
5. [Optional] In the Select Report Fields pane, select Specify Attribute Name at Run Time or Specify Model Name at Run Time check box.
6. Select the properties that you want to include in the report and click one of the following buttons:
   a. Click Run Report.
      
      If you have selected an option under Filter By, the Mart Report Filter dialog opens.
      
      Select the specific models that you want to get the results from. Enter the specific model object name. Use wildcard characters, if required.
      
      The report is generated and displayed. If you do not specify any model or entity the generated report includes all the models. If you have used a wildcard, by default, wildcard is applied to all the names. For example, if you type ID, the report includes Cust_ID and ID_For_Category.
   
   b. To add the report to the current Report Solution, click OK.

Cross-Model Reports

You can now generate a report on the properties of attributes and columns present across multiple models in a Mart. When you generate the report, you can use the filter to search within specific models. The filter supports SQL wildcard characters such as ? and %.
Follow these steps:

1. Open erwin® Data Modeler and log in to the Mart.
2. Click Tools, Report Designer.
3. Enter a name for the report and click Mart.
4. Click Attribute/Column in the Select Report Subject pane.
5. In the Select Report Fields pane, select Specify Attribute Name at Run Time or Specify Model Name at Run Time check box.
6. Select the properties that you want to include in the report.
7. Click Run Report.
8. Select the specific models that you want to get the attributes from. Enter the attribute or column name.
   By default, wildcard is applied to all the names. For example, if you type ID, the report includes Cust_ID and ID_For_Category.
9. Click OK.
   The report is generated and displayed.

Mart Model Reporting Status

When a Mart model is modified and saved, although a confirmation message appears, the erwin internal tables are still updated in the background. Further, when multiple users modify and save models simultaneously, models (internal tables) are queued for updating. If you generate a report on the model at this moment, the latest updates are not included. To provide you the correct reporting status of a model, the following enhancements are implemented:

- The Mart Open dialog is enhanced with a new column named Report Status. Report Status displays whether a model is ready for generating reports.
- The status bar of erwin Report Designer shows the number of models that are ready for generating reports. The status Mart Report sync progress (X/Y) indicates that of the Y models that are available in the Mart, X models are ready for reporting.
The Report Status column includes the following statuses:

**Updated**
- Specifies that the model is ready for report generation. When a report is generated on a model with this status, it includes the latest updates.

**Updating**
- Specifies that the model is still being updated. When a report is generated on a model with this status, it does not include the latest updates. Further, when a model is saved for the first time, the report may not include any information.

**Pending**
- Specifies that the model is queued for update. When a report is generated on a model with this status, it does not include the latest updates. Further, when a model is saved for the first time, the report may not include any information.

---

**Schedule Mart Report Synchronization**

In the Workgroup Edition, the model data and model report data are stored in separate internal tables. The model report data table (m9ReportData) includes only those columns that are required to generate model-specific reports. When you update a model and save the changes, both the tables are updated. Although erwin® Data Modeler displays a message that the model is saved, the corresponding model report data table is still being updated in the background. In this scenario, if you try to generate a report, the report may not include the details that you have just updated. This means, there is a delay in the synchronization of model data and the model report data tables.

From this release onward, you can synchronize the tables dynamically or schedule the synchronization for a later time. Typically such synchronizations are scheduled for a time when there is minimum traffic on the server. The default is dynamic synchronization.

**Dynamic Synchronization**
- Specifies that the model report data table is updated as and when the corresponding model is updated. You can see the reporting status of the source models in the Report Status column of the Mart Open dialog.

**Scheduled Synchronization**
- Specifies that the model report data table is updated at the scheduled time. You can see the reporting status of the source models in the Report Status column of the Mart Open dialog.
Follow these steps:

1. Log out of the Mart and stop the Mart Server service.

2. Navigate to the `\webapps\MartServer\WEB-INF` folder on the computer where erwin Mart Server is installed. Typically, the path for this folder is as follows:
   
   For a 32-bit version:
   ```
   <installation folder>\erwin\Mart Server r9\Tomcat\Webapps\Mart Server\WEB-INF
   ```
   
   For a 64-bit version:
   ```
   <installation folder>\erwin\Mart Server r9\Tomcat64\Webapps\Mart Server\WEB-INF
   ```

3. Open the rest-context.xml file in a text editor such as Notepad and search for the following line:
   ```
   <property name="refreshReportData" value="true" />
   ```

4. Change the value to “false”.

5. Navigate to the following line:
   ```
   <task:scheduled ref="reportTaskExecutor" method="run" cron="0 10 21 * * ?" />
   ```

6. Change the value for cron.
   
   Here, cron indicates the scheduled time. In this example, cron="0 10 21 * * ?" indicates that the models are synchronized for report generation at 9:10 pm every day.

7. Save the XML file.

8. Start the Mart Server service and log in to the Mart.

Similarly, to change from scheduled to dynamic synchronization, change the value of `<property name="refreshReportData" value="false" />` to “true”.
In the Workgroup Edition, the model data and model report data are stored in separate internal tables. The model report data table (m9ReportData) includes only those columns that are required to generate model-specific reports. When you update a model and save the changes, both the tables are updated. Although erwin® Data Modeler displays a message that the model is saved, the corresponding model report data table is still being updated in the background. In this scenario, if you try to generate a report, the report may not include the details that you have just updated. This means, there is a delay in the synchronization of model data and the model report data tables.

This delay happens because, the update process is handled by a single thread in your computer. From this release onward, you can configure a Mart to use multiple threads to update a model. Using multiple threads increases the performance of the update process and improves the time taken for large models to be available for reporting.

**Follow these steps:**

1. Log out of the Mart and stop the Mart Server service.

2. Navigate to the \webapps\MartServer\WEB-INF folder on the computer where erwin Mart Server is installed. Typically, the path for this folder is as follows:
   For a 32-bit version:
   
   <install folder>\erwin\Mart Server r9\Tomcat\Webapps\MartServer\WEB-INF
   
   For a 64-bit version:
   
   <install folder>\erwin\Mart Server r9\Tomcat64\Webapps\MartServer\WEB-INF

3. Open the rest-context.xml file in a text editor such as Notepad and navigate to the following line:

   <property name="maxPoolSize" value="8" />

4. Change the value to a number of your choice.

   The maximum number of threads that you can create depends on the system resources of your Mart server. If you enter a number, only the maximum number of threads that can be created per the system resources is created.

   **Default:** 8

5. Save the XML file.

6. Start the Mart Server service and log in to the Mart.
Mart Report Data Compression

In the Workgroup Edition, the model data and model report data are stored in separate internal tables. The model report data table (m9ReportData) includes only those columns that are required to generate model-specific reports. When you update a model and save the changes, both the tables are updated. This approach is implemented to improve the performance of Mart report generation. From this release onward, you can improve the performance of Mart reporting further by changing the way the report information is stored in the report data table.

You can store the report information in two ways--binary or XML. By default, the report information is stored in binary format. Information is compressed in binary format, therefore it occupies less space. However, regardless of the format in which the information is stored, the accuracy of the information remains the same. When you change the storage format, the information for a model is converted to the new format the next time the model is saved. After you change the storage format, if you do not update a model, the storage format for that specific model is not changed. For example, suppose that you have 50 models in your Mart and the existing storage format is XML. The report data table has stored the information for all these models in XML format. Suppose that you change the format to binary and update 10 models today. The information for the 10 models is stored in binary format and the information for the remaining 40 models is in XML format.

Follow these steps:

1. Log out of the Mart and stop the Mart Server service.
2. Navigate to the \webapps\MartServer\WEB-INF folder on the computer where erwin Mart Server is installed. Typically, the path for this folder is as follows:
   For a 32-bit version:
   \<installation folder>\erwin\Mart Server r9\Tomcat\Webapps\Mart Server\WEB-INF
   For a 64-bit version:
   \<installation folder>\erwin\Mart Server r9\Tomcat64\Webapps\Mart Server\WEB-INF
3. Open the rest-context.xml file in a text editor such as Notepad and navigate to the following line:
   <property name="compressReportData" value="true" />
   Default: True (binary format)
4. To change the format to XML, change the value to “false”.
5. Save the XML file.
6. Start the Mart Server service and log in to the Mart.
Chapter 11: SAP ASE Mart Database
Memory

Symptom:

You may experience one of the following issues when there is insufficient memory for the SAP ASE Mart database.

- You cannot save multiple Mart models in a SAP ASE Mart database.
- When you upgrade a Mart model from 8.x to r9.8 using the upgrade utility for a SAP ASE database the upgrade process fails.

Solution:

Increase the main memory and procedure cache of the database.

1. Enter the following command to increase the main memory of the database:

   ```sql
   sp_configure "max memory", <memory size>
   <memory size>
   Specifies the amount of memory that you need to increase.
   ```

2. Enter the following command to increase the procedure cache of the database:

   ```sql
   sp_configure "procedure cache size", <memory size>
   <memory size>
   Specifies the amount of memory that you need to increase.
   ```
Chapter 12: Generate the Current Diagram Picture

In addition to using the integration of Crystal Reports to create a picture report of the model diagrams, you can also use the Tools menu in erwin® Data Modeler to generate a picture report of diagrams.

To generate the current diagram picture

1. Open the diagram for which you want to generate a picture.
2. Click Diagram Picture, Generate Current Diagram Picture on the Tools menu.
   The Save As dialog opens.
3. Enter a name and location for the file and click Save.
   The generated file is saved as an .EMF (Enhanced Metafiles) image and the Save As dialog closes. To view or print the diagram image, use any image viewer program to open the file.
Chapter 13: Modify the Workstation Registry

To run the erwin 32-bit API in a 64-bit environment you must modify the workstation registry.

Follow these steps:

1. Copy the following code and paste it to a new Notepad file:

   Windows Registry Editor Version 5.00
   [HKEY_CLASSES_ROOT\Wow6432Node\CLSID\{9527D0BA-ED75-4b0e-BF48-E35565DE9852}]
   @="erwin Data Modeler Script Client API"
   "AppID"="{9527D0BA-ED75-4b0e-BF48-E35565DE9852}"
   "DllSurrogate"=""
   [HKEY_CLASSES_ROOT\Wow6432Node\CLSID\{40FDB0E6-D772-455d-B1C8-83CE79445403}]
   @="erwin Data Modeler Script Client API Property Bag"
   "AppID"="{40FDB0E6-D772-455d-B1C8-83CE79445403}"
   "DllSurrogate"=""
   [HKEY_CLASSES_ROOT\Wow6432Node\CLSID\{6774E2C3-06E9-4943-A8D4-E3007AB1F42E}]
   @="erwin Data Modeler Script Client API"
   "AppID"="{6774E2C3-06E9-4943-A8D4-E3007AB1F42E}"
   "DllSurrogate"=""

2. Name the Notepad file as 64_Bit_Upgrade.reg. Note down the folder where you have created this file.
3. After installing erwin DM version 9.0.0 through 9.8, right-click 64.Bit.Upgrade.reg and select Merge.

4. From the Windows Start menu, go to Run and type the following commands to re-register the EAL components:
   
   ```
   regsvr32.exe "<Install Dir>\erwin\Data Modeler r9\EAL.dll"
   regsvr32.exe "<Install Dir>\erwin\Data Modeler r9\Upgrade\R8_Binaries\EAL.dll".
   ```

5. Right-click 64.Bit.Upgrade.reg and select Merge again.

   You can now run erwin 32-bit API in a 64-bit environment.
Appendix A: erwin® Data Modeler Workgroup Edition Performance

This section contains the following topics:

- Optimize the Performance (see page 215)
- Reindex the Database (see page 216)
- Run the Database Statistics (see page 219)

Optimize the Performance

The performance of erwin® Data Modeler Workgroup Edition depends on many factors. This appendix outlines some steps you can take to improve your performance. The five main components where a slow down can occur are the database, the server, the network, the client PC, and the erwin® Data Modeler Workgroup Edition software.
You should regularly reindex the database and run the database statistics. Sometimes running the database statistics alone does not affect the performance, however it is good practice to run the database statistics on a regular basis to ensure the maximum performance of your database.

If you have many domains in a model, they consume a lot of memory and file space. Having too many domains can slow down erwin® Data Modeler Workgroup Edition. If you need to use many domains, we suggest you create a template model to house them, and then import the specific domains that you need, to each of your individual models. If you are using the domains to enforce unique attribute or column naming standards, you can alternatively use the erwin Glossary for that purpose.

Check the erwin® Data Modeler Workgroup Edition Release Notes for the latest system requirements. Greater CPU speed, and more RAM and disk space result in better performance.

Reindex the Database

Over a period of time, database indexes become fragmented. A large number of inserts and deletes can lead to significant performance degradation. The scripts provided in this appendix rebuild the indexes and fix them. In some cases, it can make a significant difference in the mart performance.

We recommend that you reindex your mart database nightly or during off-peak hours. As the index is recreated, the process can temporarily degrade the performance of your database. You can create an automated batch job to do the reindex. You should also reindex the database after a large model merge, a save to the mart, and right after a conversion of the mart when upgrading to a later version of the software.
Run the Oracle DBMS Reindex Script

As the new index is being built, it coexists with the old index in the database. For this reason, you should plan for enough space to store both the old index and the new index. When the index is rebuilt, the new index becomes available, the old index is dropped, and the space is reclaimed by the database. If you encounter any errors while rebuilding the indexes, re-run the statements. If you require more space to rebuild those specific indexes, add more storage to your index tablespace, and then try rebuilding those specific indexes again.

To run the Oracle DBMS reindex script

1. Create the mmreindex.ora script and copy it locally.
2. Edit the script and replace 'MODEL MART' with the name of the mart schema-owner and 'MMINDEX' with the name of the mart index tablespace. Save your changes.
3. Connect to SQL*PLUS as the user SYS.
4. Grant the 'ALTER ANY INDEX' privilege to the mart Schema Owner.
5. Run your Oracle query tool and execute the following at the SQL prompt:
   
   ```
   GRANT ALTER ANY INDEX TO <MART SCHEMA OWNER>;
   ```
6. Disconnect user SYS and Connect to your Oracle query tool as the Schema Owner.
7. Execute the following Script at the SQL Prompt:
   
   ```
   @c:\mmreindex.ora
   ```
Example: Oracle Reindex Script (MMReIndex.ora)

---

Object: MMReIndex.ora

Desc: Use this Procedure to ReIndex the MM ORACLE Repository whenever a Merge/Save of big model is done to MM

Limitation(s) is specific to Oracle Releases >= 817

For ORACLE DBMS < 8i Modify the script to Use NOPARALLEL

NOTE: You will need to change MMOWNER to the Mart schema owner name.

You will need to change MMINDEX to the Mart index tablespace.

Oracle indexes are not self-balancing. They become fragmented after a large number of INSERTs and DELETEs which may lead to significant performance degradation.

This script rebuilds the Mart indexes and cures them.

---

set pagesize 1000
set linesize 2000
set verify off
set feedback off
set heading off
spool c:\mmreindex.ora
SELECT 'ALTER INDEX ' || USER || ' .' || INDEX_NAME || ' REBUILD PARALLEL NOLOGGING COMPUTE STATISTICS TABLESPACE MMINDEX;'
FROM DBA_INDEXES
WHERE OWNER = UPPER ('MMOWNER')
AND (INDEX_NAME like 'XPK%' or INDEX_NAME like 'XAK%
  or INDEX_NAME like 'XIE%')
order by index_name;
spool off
set heading on
set pagesize 24
set verify on
set feedback on
@c:\mmreindex.ora
/

Troubleshooting the Reindexing Script

Symptom:
The query tool responds as given below:
no rows selected
not spooling currently

Solution:
You do not have the correct name for the mart schema-owner. Get the correct user name, replace 'MODELMART' with the user name, and re-run the script.
Run the Database Statistics

Database statistics show the distribution of the data in the database, and how the data is stored. When a database executes a query, it uses an optimizer to determine the best path to access the data. The optimizer relies on execution plans that specify the order in which the database accesses the tables and the exact steps used to pull the data. The database bases the creation of the execution plans on the database statistics.

As the data grows and changes, the statistics quickly become outdated and no longer reflect the true condition of the database. As a result, the execution plans no longer apply and the optimizer makes poor decisions when processing queries. You should run statistics regularly to ensure the maximum performance of your database and, therefore, your mart. We recommend that you run the database statistics nightly, and create an automated batch job to simplify the process.

Example: Oracle Statistics Commands

**Note:** In the following examples, the schema owner name is 'MODELMART'

To collect statistics for the mart (does not include the index statistics):

```sql
EXEC DBMS_STATS.gather_schema_stats ('MODELMART',DBMS_STATS.AUTO_SAMPLE_SIZE);
```

To collect statistics for the mart (includes the index statistics):

```sql
EXEC DBMS_STATS.gather_schema_stats (ownname => 'MODELMART',
cascade =>true, estimate_percent => dbms_stats.auto_sample_size);
```

To delete the statistics:

```sql
EXEC DBMS_STATS.delete_schema_stats ('MODELMART');
```
Appendix B: Changing Application Name and Port Number

There may be times when you want to change the Mart application name from MartServer to something else. Similarly, you may want to change the port number on which the Web server is running from 18170 to something else. This section gives the procedures to modify the application name and the port number.

This section contains the following topics:

How to Change the Mart Server Application Name and Port Number

How to Change the Mart Server Application Name and Port Number

There may be times when you want to change the Mart application name from MartServer to something else. Similarly, you may want to change the port number on which the Web server is running from 18170 to something else. This section gives the procedures to modify the application name and the port number.

Follow these steps:

1. Stop Tomcat server and all connections to the server.
2. If open, close the erwin Mart Configuration dialog.
3. Back up the "<installation directory>\erwin\Mart Server r9" folder.
4. Follow these steps and change the port number:
   a. Navigate to the installation folder depending on the architecture of the Mart Server and operating system. Open the Sever.xml file.
      ■ For a 32-bit Mart Server on a 32-bit operating system, go to:
        "C:\Program Files\erwin\Mart Server r9\Tomcat\conf"
      ■ For a 32-bit Mart Server on a 64-bit operating system, go to:
        "C:\Program Files (x86)\erwin\Mart Server r9\Tomcat\conf"
      ■ For a 64-bit Mart Server on a 64-bit operating system, go to:
        "C:\Program Files\erwin\Mart Server r9\Tomcat64\conf"
   b. On Line 70, change 18170 to any port number of your choice. If you have enabled SSL, change the port number (18170) in the below section (shown in green color).
5. Follow these steps and change the application name
   a. Navigate to the installation folder depending on the architecture of the Mart Server and operating system.
      ■ For a 32-bit Mart Server on a 32-bit operating system, go to: "C:\Program Files\erwin\Mart Server r9\Tomcat\webapps"
      ■ For a 32-bit Mart Server on a 64-bit operating system, go to: "C:\Program Files (x86)\erwin\Mart Server r9\Tomcat\webapps"
      ■ For a 64-bit Mart Server on a 64-bit operating system, go to: "C:\Program Files\erwin\Mart Server r9\Tomcat64\webapps"
   b. Back up the MartServer.war file and the “MartServer” folder to a different computer.
   c. Delete the “MartServer” folder.
   d. Rename MartServer.war to <your application name>.war (any qualified name).

   The file is available in the “C:\Users\<username>\AppData\Local\erwin\Mart Server” folder.

7. Navigate to the installation folder depending on the architecture of the Mart Server and operating system. Change the URL in the following batch files:
   ■ For a 32-bit Mart Server on a 32-bit operating system, go to: "C:\Program Files\erwin\Mart Server r9\Tomcat\"
   ■ For a 32-bit Mart Server on a 64-bit operating system, go to: "C:\Program Files (x86)\erwin\Mart Server r9\Tomcat\"
   ■ For a 64-bit Mart Server on a 64-bit operating system, go to: "C:\Program Files\erwin\Mart Server r9\Tomcat64"
   ■ erwin MartAdmin.bat
   ■ Disable SSL for Tomcat MartServer.bat
   ■ Enable SSL for Tomcat MartServer.bat

8. Open the erwin Mart Configuration dialog and go to the Mart Administrator tab. Enter the new port number, new application name and the password, and then click Configure. The Mart is configured with a new application name and the new port number.

9. Start the MartServer service.

10. When you log in to Mart from erwin® Data Modeler, ensure that you provide the modified port number and application name in the Connect to Mart dialog. For example, suppose that your new port number is 18172 and the new application name is erwinMartDB. In the Connect to Mart dialog, enter 18172 in the Port field, and erwinMartDB in the Application Name field.
Appendix C: Microsoft SQL Server and SAP ASE Tuning Recommendations

This section contains the following topics:

- Physical Tuning Parameters (see page 223)
- Server-Level Tuning Parameters (see page 224)
- Named Cache Configuration (see page 224)
- Database Tuning Parameters (see page 225)
- Database and Log Sizing (see page 226)
- How to Maintain an Efficient Database (see page 227)

Physical Tuning Parameters

The mart is dynamic, with many queries and data manipulations performed with each model save and load. Although the Microsoft SQL Server and SAP ASE architectures differ in some ways, the basic operation and configuration of both server environments is the same.

The configuration changes that must be made to Microsoft SQL Server and SAP ASE for optimum performance with maximum fault tolerance and recoverability are provided.

Database Placement

erwin® Data Modeler Workgroup Edition mart databases are written to in bursts of activity. Stored procedures and bulk insert statements are used to minimize overhead when saving data to Microsoft SQL Server. To optimize performance, place the database on low activity Microsoft SQL Server files. If possible, place the log and data segments on different physical drives to reduce contention between log writes and database reads.

Data Redundancy

Make sure that you make a copy of the transaction log on a separate drive to maximize recoverability of the database. If the up-time of the database is considered critical, make a copy of the database and the transaction logs, and other Microsoft SQL Server files you consider important.
Server-Level Tuning Parameters

You should perform the following server-level tuning tasks:

- Configure Microsoft SQL Server to use as much memory as possible. Allocating more memory to the Microsoft SQL Server caching mechanisms means less physical reads from the disk and improved database query performance.
- Allow several megabytes of disk space for the procedure cache because erwin® Data Modeler Workgroup Edition uses many stored procedures.

The following table shows the recommended configuration parameters for a Microsoft SQL Server running erwin® Data Modeler Workgroup Edition:

<table>
<thead>
<tr>
<th>Parameter Type</th>
<th>Recommended Value</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>memory (SAP ASE 15: “total memory”)</td>
<td>512 MB minimum</td>
<td>More memory implies less physical I/O</td>
</tr>
<tr>
<td></td>
<td>Note: 1 GB is recommended</td>
<td></td>
</tr>
<tr>
<td>procedural cache</td>
<td>Set the cache to grow to a fixed size, such as 50 MB or 100 MB.</td>
<td>erwin® Data Modeler Workgroup Edition is stored procedure-intensive</td>
</tr>
</tbody>
</table>

Named Cache Configuration

For SAP ASE systems, consider setting up a 4 KB pool for the default data cache. SAP ASE writes I/O to the log more often in 4 KB increments than in 2 KB increments (the default). You can set up a 4 KB I/O pool using sp_poolconfig, but you must restart the server to enable the 4 KB I/O writes to the log. Set the pool up as a smaller subset of the cache.

Note: Be careful when making changes to the data caching systems in SAP ASE. Monitor your changes with SQL Monitor or sp_systmon to ensure that the changes you make do not starve the 2 KB I/O pool or other caches.

The following shows the recommended size of the 4 KB I/O pool for small, medium, and large servers:

<table>
<thead>
<tr>
<th>Server Size</th>
<th>Data Cache Size</th>
<th>4 KB I/O Pool Size</th>
</tr>
</thead>
<tbody>
<tr>
<td>Small</td>
<td>128 MB</td>
<td>4 MB</td>
</tr>
<tr>
<td>Medium</td>
<td>512 MB</td>
<td>6 MB</td>
</tr>
<tr>
<td>Large</td>
<td>1 GB</td>
<td>10 MB</td>
</tr>
</tbody>
</table>
Database Tuning Parameters

You can make database tuning adjustments in three different areas:

- Transaction log
- Threshold procedures
- Database options

Transaction Log

The transaction log keeps a before and after image of each change made in the database. Microsoft SQL Server keeps a transaction log for each database.

Back up the transaction log frequently. This keeps the transaction log small and reduces the amount of data lost in the event of a severe database corruption.

Threshold Procedures

For SAP ASE, enable a threshold procedure for the last-chance threshold to back up the log when it runs out of disk space.

Note: Because Microsoft SQL Server does not provide such an option, you must back up the log frequently to keep the log small.

The following shows a sample SAP ASE threshold action procedure:

```sql
create procedure sp_thresholdaction
@dbname char(40),
@segment_name char(40),
@space_left int,
@status int
as
/* make the thresholdaction procedure backup the log */
declare @backdevice varchar(255)
select @backdevice= '/u/backups/tranfile' + convert(char(8),getdate(),4)
dump tran
transaction mart to @backdevice
```
"trunc. log on chkpt" Option

To ensure maximum recoverability, do not enable the “trunc. log on chkpt” option, since the log is cleared automatically after each checkpoint operation. If the database device becomes damaged with the log device still active and this option is set, the database cannot be recovered using the log files since they are almost empty.

Database and Log Sizing

Since the database is a dynamic environment, allow plenty of space for the models you create. Tests have shown that models generate between 10 KB and 20 KB of data per entity during initial save times. Log overhead per object is approximately 15 KB to 21 KB per entity. Allocate 50 to 65 percent of the database size to the log to avoid running out of room in the log for a typical model save.

An average mart can range in size between 200 MB and 1 Gig. Size the transaction log accordingly. A 50 MB data device can store several large models (about 2,500 entities and 100,000 total objects), but keep in mind that the database becomes more flexible and has less storage space issues when the data device is large.

The following table shows the recommended database size and log size for small, medium, and large marts:

<table>
<thead>
<tr>
<th>Database Size</th>
<th>Database Device</th>
<th>Transaction Log Device</th>
</tr>
</thead>
<tbody>
<tr>
<td>Small</td>
<td>200 MB</td>
<td>100 MB</td>
</tr>
<tr>
<td>Medium</td>
<td>500 MB</td>
<td>200 MB</td>
</tr>
<tr>
<td>Large</td>
<td>1 GB</td>
<td>400 MB</td>
</tr>
</tbody>
</table>
How to Maintain an Efficient Database

To maintain an efficient database, perform the following maintenance tasks:

- Run UPDATE STATISTICS and execute sp_recompile frequently on every table in the database. This keeps the statistics up-to-date for the indexes, resulting in better overall performance.

- Periodically recreate the clustered indexes in the database to reduce fragmentation. Be sure to back up the database and transaction log daily.

- Run DBCC CheckDB(), DBCC CheckCatalog(), and DBCC CheckAlloc() or DBCC NewAlloc() on the database nightly, to check for corruption and inconsistencies in the database. Check the output of these queries and look for keywords like corrupt. Any problems detected by these commands are sent to the query output, so save the files and scan them regularly.

The following table shows maintenance tasks and the recommended frequency for performing these tasks:

<table>
<thead>
<tr>
<th>Maintenance Task</th>
<th>Recommended Frequency</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBCC Checkdb</td>
<td>Nightly</td>
<td>Check for corruption in databases.</td>
</tr>
<tr>
<td>DBCC NewAlloc</td>
<td>Weekly</td>
<td>Check for allocation corruption</td>
</tr>
<tr>
<td></td>
<td></td>
<td>(Microsoft SQL Server only).</td>
</tr>
<tr>
<td>DBCC Check Alloc</td>
<td>Weekly</td>
<td>Check for allocation corruption</td>
</tr>
<tr>
<td></td>
<td></td>
<td>(Microsoft SQL Server only).</td>
</tr>
<tr>
<td>DBCC Check Catalog</td>
<td>Weekly</td>
<td>Check for system table inconsistencies.</td>
</tr>
<tr>
<td>UPDATE STATISTICS</td>
<td>Nightly</td>
<td>Recreates the statistics page for each index.</td>
</tr>
<tr>
<td>EXEC sp_recompile</td>
<td>Nightly</td>
<td>Tells which stored procedures have changed.</td>
</tr>
<tr>
<td>Backup Database</td>
<td>Weekly</td>
<td>Full backup of database should be done at least weekly, if not nightly.</td>
</tr>
<tr>
<td>Backup Transaction Log</td>
<td>Daily</td>
<td>Backing up the transaction log daily saves all committed transactions and clears the log.</td>
</tr>
</tbody>
</table>
DBCC Commands

Use the following DBCC commands to perform maintenance tasks on the database:

DBCC CheckDB(mart)
  go
DBCC CheckAlloc(mart)
  go
DBCC CheckCatalog(mart)
  go
Appendix D: Oracle Tuning Recommendations

This section contains the following topics:

- Recommended Disk Configurations (see page 229)
- Database Configuration (see page 230)
- Storage Parameters (see page 235)

Recommended Disk Configurations

Oracle servers are available on many different platforms ranging from PCs to mainframes. To support the wide range of hardware platforms and application requirements, Oracle servers have a number of configuration options that you can use to tailor the behavior of an Oracle database. You can also use these configuration options to tailor your database. Some of the options documented in this guide only apply to specific Oracle versions. For further information, see the appropriate Oracle documentation.

If the Oracle server is not dedicated to the erwin® Data Modeler Workgroup Edition, as database administrator you must be careful to balance the requirements of all users on the server. This is particularly true for database servers that support OLTP (On Line Transaction Processing) applications that require tight response characteristics.

The layout of Oracle database files on physical disk drives plays a major role in the performance of the database. When used with erwin® Data Modeler Workgroup Edition, Oracle performs large bursts of database operations (fetches, inserts, updates, and deletes) in a short period of time. This usage pattern often requires Oracle to perform a significant amount of disk I/O operations. For good performance, it is important that as many I/O operations as possible be performed in parallel. This enables Oracle to retrieve data faster during fetches and to write data faster during inserts, updates, and deletes.

To maximize parallel I/O access, split the Oracle database files across many physical disks. Ideally, you should place the database on four physical disks. If this is not possible, you can use three, two, or one disk systems.

Note: Installing Oracle on a single disk system causes significant performance degradation.
Database Configuration

Proper database configuration is essential to the smooth operation and good performance of an Oracle database. You can use the configuration options described to optimize the processing of your Oracle server.

Maximum Number of Processes

Oracle must be preconfigured at startup with a maximum number of processes that can access the database. The parameter that controls the maximum number of processes, called PROCESSES, is defined in the INIT.ora or INIT<SID>.ora file. It should be set to the maximum potential number of concurrent users plus seven. The additional seven are for Oracle background processes that must also access the database. Setting the number of processes at a lower value can prevent some users from accessing the server during peak usage times. Setting the number of processes at a higher value can waste a small amount of system memory resources.

Shared Pool

The shared pool is an area of Oracle memory that includes two main structures:

- The library cache, which stores parsed SQL and PL/SQL statements
- The dictionary cache, which stores the Oracle data dictionary (or Oracle metadata)

The SHARED_POOL_SIZE parameter is defined in the INIT.ora or INIT<SID>.ora file and is used to regulate the size of the shared pool. Set the SHARED_POOL_SIZE parameter to a minimum of 3500000 (3.5 million). Setting the shared pool to a smaller value can degrade performance, forcing Oracle to do disk I/O to retrieve objects that cannot fit in the shared pool. A larger shared pool may be required, depending on the size and number of models and the number of users.
**Buffer Cache**

The buffer cache serves as a memory cache for all data going to and from Oracle data files. When Oracle needs a block of data, it first checks whether that block exists in the buffer cache. If it does, Oracle gets the data from the buffer cache—avoiding disk access. Having a large enough buffer cache lets the Oracle server bypass most I/O requests.

Buffer cache size is controlled by the `DB_BLOCK_BUFFERS` parameter defined in the `INIT.ora` or `INIT<SID>.ora` file. Set the buffer cache to a minimum of 4 MB. Values smaller than 4 MB force Oracle to do many more I/O requests and significantly degrade performance. Values larger than 4 MB improve performance and should be used if memory is available.

*Note:* In Oracle, the `DB_BLOCK_BUFFERS` parameter is specified as a number of database blocks instead of actual size in bytes. To compute the value of `DB_BLOCK_BUFFERS`, divide the desired buffer cache size in bytes by the database block size defined by the `DB_BLOCK_SIZE` parameter in the `INIT.ora` or `INIT<SID>.ora` file.

**Redo Log Files**

Redo log files contain a record of all Data Manipulation Language (DML) commands (such as INSERT, UPDATE, and DELETE commands) performed on the database. As DMLs are performed, the Oracle engine writes them to sequential redo log files. Periodically, an Oracle background process retrieves the DMLs from the Redo log files and writes the actual changes to the Oracle tablespace files. This mechanism lets Oracle defer most of the I/O burden associated with DMLs to a background process that does not slow down the client processes.

*Note:* Oracle Redo log files are treated by the database engine as a ring. When one file fills up, the engine performs a log switch and starts writing to the next log file in the ring. When that log file fills, the engine switches again.

The number and size of the Redo log files is an important performance consideration. If the log files are too small or if there are not enough of them in the ring, Oracle may have to stall on a log switch. If this happens, the DMLs in the next log in the ring may not have been written to the tablespace files, and therefore the next log file has not been archived by the background ARCH process. For more information about Redo log archiving, see the Oracle documentation.

Redo log files are created when the database is created. However, Redo log files can be added or deleted at any time using Data Definition Language (DDL) statements.
You should have at least four Redo log files, each 2 MB in size. A smaller number of Redo log files or a smaller Redo log file size can cause I/O bottlenecks. If the disk space is available, using more than four Redo log files further reduces the chances of delayed log switches. Larger Redo log files improve performance, but care must be taken to adequately schedule checkpoints that write DMLs stored in the Redo logs to the tablespace files.

If the number of disks permits, you should mirror Redo log files by creating Redo log groups with two mirrored members per group. This offers the database some protection against single disk errors.

**Increase Space in Redo Logs**

The number and size of the Redo log files is an important performance consideration. Redo log files are created when the database is created.

**To increase space in the Redo logs**

1. Log in to Oracle using SQL*Plus as SYSDBA or SYSOPER and run the following script to create eight Redo logs that are 2 MB each:

```sql
rem -- parm1 -- temp dir
rem Generate creation script
SELECT 'ALTER DATABASE ADD LOGFILE ''' || SUBSTR ( MEMBER , 1 , INSTR ( MEMBER , '
' , -1 , 1 ) ) || 'REDO_11.LOG'' SIZE 2M ;'
from V$LOGFILE
where ROWNUM = 1
and not exists ( SELECT 1 from V$LOGFILE where MEMBER like '%REDO_11.LOG' )
UNION

SELECT 'ALTER DATABASE ADD LOGFILE ''' || SUBSTR ( MEMBER , 1 , INSTR ( MEMBER , '
' , -1 , 1 ) ) || 'REDO_12.LOG'' SIZE 2M ;'
from V$LOGFILE
where ROWNUM = 1
and not exists ( SELECT 1 from V$LOGFILE where MEMBER like '%REDO_12.LOG' )
UNION

SELECT 'ALTER DATABASE ADD LOGFILE ''' || SUBSTR ( MEMBER , 1 , INSTR ( MEMBER , '
' , -1 , 1 ) ) || 'REDO_13.LOG'' SIZE 2M ;'
from V$LOGFILE
where ROWNUM = 1
and not exists ( SELECT 1 from V$LOGFILE where MEMBER like '%REDO_13.LOG' )
UNION
```
SELECT 'ALTER DATABASE ADD LOGFILE '''
| SUBSTR ( MEMBER, 1, INSTR ( MEMBER, '\\', -1, 1 ) )
| 'REDO_14.LOG' SIZE 2M ;'
from V$LOGFILE
where ROWNUM = 1
and not exists ( SELECT 1 from V$LOGFILE where MEMBER like '%REDO_14.LOG' )
UNION
SELECT 'ALTER DATABASE ADD LOGFILE '''
| SUBSTR ( MEMBER, 1, INSTR ( MEMBER, '\\', -1, 1 ) )
| 'REDO_15.LOG' SIZE 2M ;'
from V$LOGFILE
where ROWNUM = 1
and not exists ( SELECT 1 from V$LOGFILE where MEMBER like '%REDO_15.LOG' )
UNION
SELECT 'ALTER DATABASE ADD LOGFILE '''
| SUBSTR ( MEMBER, 1, INSTR ( MEMBER, '\\', -1, 1 ) )
| 'REDO_16.LOG' SIZE 2M ;'
from V$LOGFILE
where ROWNUM = 1
and not exists ( SELECT 1 from V$LOGFILE where MEMBER like '%REDO_16.LOG' )
UNION
SELECT 'ALTER DATABASE ADD LOGFILE '''
| SUBSTR ( MEMBER, 1, INSTR ( MEMBER, '\\', -1, 1 ) )
| 'REDO_17.LOG' SIZE 2M ;'
from V$LOGFILE
where ROWNUM = 1
and not exists ( SELECT 1 from V$LOGFILE where MEMBER like '%REDO_17.LOG' )
UNION
SELECT 'ALTER DATABASE ADD LOGFILE '''
| SUBSTR ( MEMBER, 1, INSTR ( MEMBER, '\\', -1, 1 ) )
| 'REDO_18.LOG' SIZE 2M ;'
from V$LOGFILE
where ROWNUM = 1
and not exists ( SELECT 1 from V$LOGFILE where MEMBER like '%REDO_18.LOG' )
.
Spool &1.AddLog.ORA
/
Spool Off
COMMIT ;
SELECT 'ALTER SYSTEM SWITCH LOGFILE ;' from V$LOG where ROWNUM < 5
.
Spool &1.SwtchLog.ORA
/
Spool Off
COMMIT ;
rem Generate Deletion script
SELECT 'ALTER DATABASE DROP LOGFILE GROUP ' || TO_CHAR ( GROUP# ) || ' ' FROM V$LOG WHERE BYTES < 2097152
.
Spool &1.DropLog.ORA
/
Spool Off
COMMIT ;

@&1.AddLog.ORA
$Del &1.AddLog.ORA
COMMIT ;

@&1.SwtchLog.ORA
$Del &1.SwtchLog.ORA
COMMIT ;

@&1.DropLog.ORA
$Del &1.DropLog.ORA
COMMIT ;

2. Run the following query to verify the new Redo log configuration:

SQLWKS> select group#, status, bytes from v$log;

Note: Oracle does not let you drop an older Redo log file that is still ACTIVE. If you must drop an older Redo log file that is still ACTIVE, drop that log file manually.

Redo Log Buffer

The Redo log buffer is an area in memory that Oracle uses to collect DMLs before they are written to the Redo log files. The log file write occurs when either a transaction commits or a Redo log buffer is full. Because erwin® Data Modeler Workgroup Edition tends to generate fairly large transactions, use a log buffer size of 163840 bytes. (For single disk Oracle installations, use a log buffer size of 655360 bytes.) Setting the Redo log buffer size to a value smaller than the recommended value can degrade I/O performance. Using a larger value requires more memory.

The Redo log buffer size is defined using the LOG_BUFFER parameter in the INIT.ora or INIT<SID>.ora file.
Checkpoints

An Oracle checkpoint is an event that posts DMLs from the Redo log files to the tablespace files. Checkpoints always occur after a Redo log file switch and can also be configured to occur at predefined time intervals. For erwin® Data Modeler Workgroup Edition, which generates large transactions, checkpoints should occur only after log switches to minimize I/O.

To ensure a checkpoint only after a log switch, do not set the LOG_CHECKPOINT_INTERVAL and LOG_CHECKPOINT_TIMEOUT parameters in the INIT.ora or INIT<SID>.ora file.

Storage Parameters

Object storage parameters in Oracle determine the amount of space allocated for each object in the database. Setting these parameters correctly is critical to both operation and performance of the database. Incorrect storage allocations can cause a database object to run out of space, which prevents you from saving models to the repository. Inefficient selection of storage parameters can lead to performance problems by forcing Oracle to do time-consuming space management operations during DML statement execution.

Recommendations for storage parameter values differ based on the size of your model:

- Small data models: 1 to 50 Entities
- Medium data models: 51 to 100 Entities
- Large data models: over 100 Entities
Rollback Segments

Rollback segments contain undo information for all changes performed by noncommitted transactions. Rollback segments are a shared resource used by all active transactions in the database. When a transaction starts, Oracle binds that transaction to a particular rollback segment. As DMLs in the transaction execute, rollback segment space is used. For large transactions, rollback segments may need to allocate new extents as the transaction continues. When the transaction ends, a properly configured Oracle database releases the additional rollback extents so that they can be used for other rollback segments. To ensure that the additional rollback extents are released, configure the OPTIMAL parameter for each rollback segment.

Use a maximum of five transactions per rollback segment by setting the TRANSACTIONS_PER_ROLLBACK_SEGMENT parameter in the INIT.ora or INIT<SID>.ora file. Use the following rollback segment storage parameters for small, medium, and large models:

<table>
<thead>
<tr>
<th>Model Type</th>
<th>Initial Extent Size</th>
<th>Next Extent Size</th>
<th>Optimal Size</th>
</tr>
</thead>
<tbody>
<tr>
<td>Small</td>
<td>1 MB</td>
<td>1 MB</td>
<td>~ 2 MB x (# of transactions)</td>
</tr>
<tr>
<td>Medium</td>
<td>6 MB</td>
<td>6 MB</td>
<td>~ 12 MB x (# of transactions)</td>
</tr>
<tr>
<td>Large</td>
<td>6 MB</td>
<td>6 MB</td>
<td>~ 12 MB x (# of transactions)</td>
</tr>
</tbody>
</table>

**Note:** The “# of transactions” is the maximum number of simultaneous erwin® Data Modeler Workgroup Edition connections to Oracle.

In Oracle it is common to see the following error statement when the Rollback logs are not set up optimally:

**ORA-01562 failed to extend rollback segment number string**
Set Optimal Configuration for the Rollback Logs

For large transactions, rollback segments may need to allocate new extents as the transaction continues. When the transaction ends, a properly configured Oracle database releases the additional rollback extents so that they can be used for other rollback segments. To ensure that the additional rollback extents are released, configure the OPTIMAL parameter for each rollback segment.

**To set the optimal configuration for the rollback logs of large databases**

1. Log in to Oracle as SYS or SYSTEM and run the following query and check the result to view the current configuration of the Rollback Segments:

   ```sql
   SQLWKS> select SEGMENT_NAME, INITIAL_EXTENT, NEXT_EXTENT, MIN_EXTENTS, MAX_EXTENTS, STATUS from dba_rollback_segs;
   ``

   The result is:

<table>
<thead>
<tr>
<th>SEGMENT_NAME</th>
<th>INITIAL_EXTENT</th>
<th>NEXT_EXTENT</th>
<th>MIN_EXTENTS</th>
<th>MAX_EXTENTS</th>
<th>STATUS</th>
</tr>
</thead>
<tbody>
<tr>
<td>SYSTEM</td>
<td>51200</td>
<td>51200</td>
<td>2</td>
<td>121</td>
<td>ONLINE</td>
</tr>
<tr>
<td>R8_TEMP</td>
<td>102400</td>
<td>102400</td>
<td>2</td>
<td>121</td>
<td>OFFLINE</td>
</tr>
<tr>
<td>RB1</td>
<td>2097152</td>
<td>2097152</td>
<td>2</td>
<td>121</td>
<td>ONLINE</td>
</tr>
<tr>
<td>RB2</td>
<td>2097152</td>
<td>2097152</td>
<td>2</td>
<td>121</td>
<td>ONLINE</td>
</tr>
<tr>
<td>RB3</td>
<td>2097152</td>
<td>2097152</td>
<td>2</td>
<td>121</td>
<td>ONLINE</td>
</tr>
<tr>
<td>RB4</td>
<td>2097152</td>
<td>2097152</td>
<td>2</td>
<td>121</td>
<td>ONLINE</td>
</tr>
<tr>
<td>RB5</td>
<td>2097152</td>
<td>2097152</td>
<td>2</td>
<td>121</td>
<td>ONLINE</td>
</tr>
<tr>
<td>RB6</td>
<td>2097152</td>
<td>2097152</td>
<td>2</td>
<td>121</td>
<td>ONLINE</td>
</tr>
<tr>
<td>RB7</td>
<td>2097152</td>
<td>2097152</td>
<td>2</td>
<td>121</td>
<td>ONLINE</td>
</tr>
<tr>
<td>RB8</td>
<td>2097152</td>
<td>2097152</td>
<td>2</td>
<td>121</td>
<td>OFFLINE</td>
</tr>
<tr>
<td>RB9</td>
<td>2097152</td>
<td>2097152</td>
<td>2</td>
<td>121</td>
<td>OFFLINE</td>
</tr>
<tr>
<td>RB10</td>
<td>2097152</td>
<td>2097152</td>
<td>2</td>
<td>121</td>
<td>OFFLINE</td>
</tr>
<tr>
<td>RB11</td>
<td>2097152</td>
<td>2097152</td>
<td>2</td>
<td>121</td>
<td>OFFLINE</td>
</tr>
<tr>
<td>RB12</td>
<td>2097152</td>
<td>2097152</td>
<td>2</td>
<td>121</td>
<td>OFFLINE</td>
</tr>
<tr>
<td>RB13</td>
<td>2097152</td>
<td>2097152</td>
<td>2</td>
<td>121</td>
<td>OFFLINE</td>
</tr>
<tr>
<td>RB14</td>
<td>2097152</td>
<td>2097152</td>
<td>2</td>
<td>121</td>
<td>OFFLINE</td>
</tr>
<tr>
<td>RB15</td>
<td>2097152</td>
<td>2097152</td>
<td>2</td>
<td>121</td>
<td>OFFLINE</td>
</tr>
<tr>
<td>RB16</td>
<td>2097152</td>
<td>2097152</td>
<td>2</td>
<td>121</td>
<td>OFFLINE</td>
</tr>
</tbody>
</table>

18 rows selected.

**Note:** In this example, there are sixteen rollback segments with 2 MB INITIAL EXTENT, 2 MB NEXT EXTENT, and MAX EXTENTS of 121 MB.
2. Run the following query for each Rollback Segment:

```sql
alter rollback segment rb1 offline;
drop rollback segment rb1;
create public rollback segment rb1
tablespace rollback_data
storage (initial 6M
next 6M
minextents 2
maxextents 121
optimal 12M);
alter rollback segment rb1 online;
alter rollback segment rb2 offline;
drop rollback segment rb2;
create public rollback segment rb2
tablespace rollback_data
storage (initial 6M
next 6M
minextents 2
maxextents 121
optimal 12M);
alter rollback segment rb2 online;
```

<Repeat for each Rollback Segment>

This query sets the optimal Rollback Segment configuration to 6 MB INITIAL EXTENT, 6 MB NEXT EXTENT, 2 MB MIN EXTENT, 121 MB MAX EXTENT, and 12 MB OPTIMAL.
3. Run the following query to verify the Rollback segment configuration changes:

   SQL> select SEGMENT_NAME, INITIAL_EXTENT, NEXT_EXTENT, MIN_EXTENTS, MAX_EXTENTS, STATUS from dba_rollback_segs;

   The result is:

<table>
<thead>
<tr>
<th>SEGMENT_NAME</th>
<th>INITIAL_EXTENT</th>
<th>NEXT_EXTENT</th>
<th>MIN_EXTENTS</th>
<th>MAX_EXTENTS</th>
<th>STATUS</th>
</tr>
</thead>
<tbody>
<tr>
<td>SYSTEM</td>
<td>51200</td>
<td>51200</td>
<td>2</td>
<td>121</td>
<td>ONLINE</td>
</tr>
<tr>
<td>RB_TEMP</td>
<td>102400</td>
<td>102400</td>
<td>2</td>
<td>121</td>
<td>OFFLINE</td>
</tr>
<tr>
<td>RB1</td>
<td>6291456</td>
<td>6291456</td>
<td>2</td>
<td>121</td>
<td>ONLINE</td>
</tr>
<tr>
<td>RB2</td>
<td>6291456</td>
<td>6291456</td>
<td>2</td>
<td>121</td>
<td>ONLINE</td>
</tr>
<tr>
<td>RB3</td>
<td>6291456</td>
<td>6291456</td>
<td>2</td>
<td>121</td>
<td>ONLINE</td>
</tr>

<td>6291456</td>
<td>6291456</td>
<td>2</td>
<td>121</td>
<td>ONLINE</td>
</tr>
<tr>
<td>RB16</td>
<td>6291456</td>
<td>6291456</td>
<td>2</td>
<td>121</td>
<td>ONLINE</td>
</tr>
</tbody>
</table>

   18 rows selected.

### Tablespaces

To improve performance you can create more than one tablespace for indexes. Then, after you install the software, you can move some indexes to the other tablespaces.

The following table lists the suggested initial sizes for DATA and INDEX tablespaces:

<table>
<thead>
<tr>
<th>Tablespace</th>
<th>Small</th>
<th>Medium</th>
<th>Large</th>
</tr>
</thead>
<tbody>
<tr>
<td>DATA</td>
<td>200 MB</td>
<td>500 MB</td>
<td>1 GB</td>
</tr>
<tr>
<td>INDEX</td>
<td>200 MB</td>
<td>250 MB</td>
<td>500 MB</td>
</tr>
</tbody>
</table>

DATA and INDEX tablespaces with these initial sizes can accommodate at least ten models or versions.
Appendix E: Sample Files

This section contains the following topics:

- Sample workers.properties File (see page 242)
- Sample isapi_redirect.properties File (see page 243)
- Sample isapi_redirect.reg File (see page 244)
- Sample uniworkers.properties File (see page 244)
- Sample uriworkermap.properties File (see page 244)
The workers.properties file includes the following parameters:

- worker.list
- worker.<workername>.host
- worker.<workername>.port
- worker.<workername>.type
- worker.<workername>.connection_pool_size

The descriptions of the parameters are as follows:

**workers. list**
Lists all the workers that are defined. When you start the web server, the plug-in instantiates these workers.

**worker.<workername>.host**
Defines the IP address of the computer where Tomcat (WA-OP) is installed.

**worker.<workername>.port**
Defines the port that the AJP workers inside Tomcat listen to. By default, AJP13.Workers listen to port 8009.

**worker.<workername>.type**
Defines the type of worker. The type of the worker can be ajp13, ajp14, jni, lb, or status.

**worker.<workername>.connection_pool_size**
Defines the number of connections made to AJP back-end.

The following is a sample workers.properties file:

```
# This file provides minimal jk configuration properties needed to
# connect to Tomcat.
#
# The workers that jk should create and work with
#
worker.list=lb,jk-status
#
# Defining a worker named node1 and of type ajp13
#
worker.node1.type=ajp13
```
Sample isapi_redirect.properties File

The following is a sample isapi_redirect.properties file:

```properties
worker.node1.host=localhost
worker.node1.port=8009
#
# Defining a load balancer
#
worker.lb.type=lb
worker.lb.balance_workers=node1
#
# Define status worker
#
worker.jk-status.type=status
```

Sample isapi_redirect.properties File

In this example, *jakarta* refers to the virtual directory you have added before you created the ISAPI filter.
Sample isapi_redirect.reg File

The following is a sample isapi_redirect.reg file:

REGEDIT4

[HKEY_LOCAL_MACHINE\SOFTWARE\Apache Software Foundation\Jakarta Isapi Redirector\1.0]
"extension_uri"="/jakarta/isapi_redirect.dll"
"log_file"="<path to the native_iis folder>\native_IIS\logs\isapi.log"
"log_level"="debug"
"worker_file"="<path to the native_iis folder>\native_IIS\workers.properties"
"worker_mount_file"="<path to the native_iis folder>\native_IIS\urisworkermap.properties"

In this example, jakarta refers to the virtual directory you have added before you created the ISAPI filter.

Sample uniworkers.properties File

The following is a sample uniworkers.properties file:

/MartServer/*=node1

Sample urisworkermap.properties File

The following is a sample urisworkermap.properties file:

# This file provides sample mappings for example wlb
# worker defined in workermap.properties.minimal
# The general syntax for this file is:
# [URL]=[Worker name]
/*=lb

# Mount jkstatus to /jkmanager
# For production servers you will need to
# secure the access to the /jkmanager url
#
/jk-manager=jk-status
