

erwin[®] Data Modeler

Creating Custom Mart Reports Using a Reporting Tool

Release 2018 R1

This Documentation, which includes embedded help systems and electronically distributed materials (hereinafter referred to as the "Documentation"), is for your informational purposes only and is subject to change or withdrawal by erwin Inc. at any time. This Documentation is proprietary information of erwin Inc. and may not be copied, transferred, reproduced, disclosed, modified or duplicated, in whole or in part, without the prior written consent of erwin Inc.

If you are a licensed user of the software product(s) addressed in the Documentation, you may print or otherwise make available a reasonable number of copies of the Documentation for internal use by you and your employees in connection with that software, provided that all erwin Inc. copyright notices and legends are affixed to each reproduced copy.

The right to print or otherwise make available copies of the Documentation is limited to the period during which the applicable license for such software remains in full force and effect. Should the license terminate for any reason, it is your responsibility to certify in writing to erwin Inc. that all copies and partial copies of the Documentation have been returned to erwin Inc. or destroyed.

TO THE EXTENT PERMITTED BY APPLICABLE LAW, ERWIN INC. PROVIDES THIS DOCUMENTATION "AS IS" WITHOUT WARRANTY OF ANY KIND, INCLUDING WITHOUT LIMITATION, ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NONINFRINGEMENT. IN NO EVENT WILL ERWIN INC. BE LIABLE TO YOU OR ANY THIRD PARTY FOR ANY LOSS OR DAMAGE, DIRECT OR INDIRECT, FROM THE USE OF THIS DOCUMENTATION, INCLUDING WITHOUT LIMITATION, LOST PROFITS, LOST INVESTMENT, BUSINESS INTERRUPTION, GOODWILL, OR LOST DATA, EVEN IF ERWIN INC. IS EXPRESSLY ADVISED IN ADVANCE OF THE POSSIBILITY OF SUCH LOSS OR DAMAGE.

The use of any software product referenced in the Documentation is governed by the applicable license agreement and such license agreement is not modified in any way by the terms of this notice.

The manufacturer of this Documentation is erwin Inc.

Provided with "Restricted Rights." Use, duplication or disclosure by the United States Government is subject to the restrictions set forth in FAR Sections 12.212, 52.227-14, and 52.227-19(c)(1) - (2) and DFARS Section 252.227-7014(b)(3), as applicable, or their successors.

Understanding your Support

Review [support maintenance programs and offerings](#).

Registering for Support

Access the [erwin support](#) site and click Sign in to register for product support.

Accessing Technical Support

For your convenience, erwin provides easy access to "One Stop" support for all editions of [erwin Data Modeler](#), and includes the following:

- Online and telephone contact information for technical assistance and customer services
- Information about user communities and forums
- Product and documentation downloads
- erwin Support policies and guidelines
- Other helpful resources appropriate for your product

For information about other erwin products, visit <http://erwin.com/products>.

Provide Feedback

If you have comments or questions, or feedback about erwin product documentation, you can send a message to techpubs@erwin.com.

Chapter 1: Introduction

erwin Data Modeler (DM) version 9 onward uses an XML-based interface that allows XML-based reporting tools to retrieve information from the erwin Mart. Use the XML-based interface to report on the following objects that are stored in the Mart.

- Catalog Information
- Model objects and their properties
- Users
- Lock information
- Profiles
- Permissions

This section contains the following topics

[Architecture](#) (see page 8)

[Generate Reports using a Reporting Tool](#) (see page 9)

Architecture

When users generate a report, erwin Version 9 Mart retrieves data from the Mart Server via web services.

The components involved in reporting are as follows:

- A reporting tool that can report on XML data; for example Crystal Reports.
- Mart Server, which is a component of erwin Version 9 Mart installation.
- Mart database, which is the data source for the Mart Server.

erwin Data Modeler (DM) Release 8 Mart reported directly against the Mart database. This approach has changed in erwin DM Version 9 Mart onward.

The following steps describe the process of generating reports in erwin DM Mart, version 9 onward :

1. Reporting tools such as Crystal Reports connect to the Mart Server through web services.
2. Web services return the report information in XML data format.
3. Reporting tools use this XML information as the dataset and display the report.

The following diagram illustrates the reporting architecture:

Generate Reports using a Reporting Tool

This section describes how to generate reports using a reporting tool.

Before attempting to generate a report, ensure that you have the View permissions on the Mart on which you want to report.

Follow these steps:

1. Start the web server where you have installed Mart Server, for example, start Tomcat.
2. Use your reporting tool wizard and create a connection that uses XML and Web Services as the data source.
3. Use the HTTP(S) Data Source.
4. Follow report wizard steps.
5. Use the following format to enter the URL for HTTP(S) XML URL:

```
http://<Server Name>:<Port No>/MartServer/service/report/generateReport/<Report Name>/<Username>/<Password>
```

For example:

```
http://localhost:8084/MartServer/service/report/generateReport/Users/sa/erwin
```

6. Use the following format to enter the URL for HTTP(S) Schema:

For example:

```
http://<Server Name>:<Port No>/MartServer/service/report/generateSchema/<Schema Name>/<Username>/<Password>
```

For example:

```
http://localhost:8084/MartServer/service/report/generateSchema/Users/sa/erwin
```

The URL details are as follows:

- <Server Name>: Machine name where Mart Server is running.
- <Port No>: Port number on which J2EE container is running.
- <Report Name>: Name of the report which being created.
- <Schema Name>: Name of the report schema which is being created.
- <Username>: Username for a server user in Mart Server.
- <Password>: Password for a server user in Mart Server.

Enter the report URL and schema URL in the browser Address bar to see the correct data. If the username and/or password is incorrect or if you do not have the required authorization to View Reports on the Mart Server, the message, Logon Failed appears.

7. After the new connection is successfully created, expand it.

8. Select the tables for which you want to generate a report and create the report.

Chapter 2: Creating a Custom Mart Report

This section contains the following topics

[Create Custom Mart Reports](#) (see page 11)

[Define a New Report](#) (see page 12)

[Define the Report Schema](#) (see page 14)

Create Custom Mart Reports

erwin Data Modeler (DM) Mart, version 9 onward lets you create custom Mart reports. A custom Mart report requires two XML files, the report definition file and the report schema file. The report definition file includes names of the tables and columns that you want to include in the report. The report schema file includes how you want the tables and columns to appear in the report. Sample definition and schema files are included as part of the installation files.

This section describes how to edit the sample files to add new or modify existing reports.

The basic tables and columns to report are organized as shown below:

Follow these steps to generate a new report:

1. Define the report definition.
2. Define the report schema.
3. Execute it using a reporting tool.

Define a New Report

The reports.xml file includes report definitions for all the Mart reports. This file is available in the MartServer\WEB-INF folder. Edit this file to modify an existing report definition or add a new report definition.

Report definitions have the following characteristics:

- Report definitions are created in XML format.
- Reports have a unique name that identifies the report.
- Reports are defined using XML elements.

The basic XML elements and tags are shown in the example below.

Follow these steps:

1. Open the MartServer\WEB-INF\Reports.xml file.
2. Enclose report definition within the <report> element.
3. Define a name for the report within the <Name> element.
4. Define each table that you want to include in the report. In the example below, the report is generated on the User table.
5. Enclose the properties or columns of the required table that you want to appear in the output within the <Report_Output> element.
6. Include all properties to report on within the <Property> element.
7. Define each column to report on within the <Type> tag.
8. Close all the tags.
9. (Optional) execute this report in a web browser. Use the URL for reports described in the previous procedure.

An example of defining a report on Users is shown below:

```
<report>
  <Name>Users</Name>
  <User>
    <Report_Output>
      <Property>
        <Type>ID</Type>
        <Type>Username</Type>
        <Type>EmailID</Type>
      </Property>
    </Report_Output>
  </User>
</report>
```

```
        <Type>UserType</Type>
        <Type>IsInternal</Type>
        <Type>IsDeleted</Type>
    </Property>
    <Report_Output>
</User>
</report>
```

Define the Report Schema

A schema defines the expected output. The report schema for all Mart reports is defined in the reports-schema.xml file. This file is available in the MartServer\WEB-INF folder. Help ensure that the report data output always conforms to the schema definition.

Report schemas have the following characteristics:

- Report schemas are created in XML format.
- Report schemas have a unique name that identifies the schema. We recommend that you have this name same as that of the report name.
- Reports are defined using XML elements.

Follow these steps:

1. Open the MartServer\WEB-INF\Reports-schema.xml file.
2. Enclose report schema definition within the <report_schema> element.
3. Define a name for the report schema within the <Name> element.
4. Define the Schema within the <schema> element in the CDATA section.
5. Defining a schema definition within the CDATA section helps XML accept the XML related information within an XML definition.

Note: There are various tools to generate Schema Definition (that is, XSD) information from a XML. You can generate the schema definition using a tool of your choice and include it in the reports-schema.xml file.

An example of defining a report schema on Users is shown below.

```
<report_schema>

<Name> Users </Name>

  <schema>

    <Report_Output>

      <![CDATA[<xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema">

        <xs:element name="report_root">

          <xs:complexType>

            <xs:sequence>

              <xs:element name="User" maxOccurs="unbounded">

                <xs:complexType>

                  <xs:sequence>
```

```
<xs:element name="Id" type="xs:string"/>
<xs:element name="Username" type="xs:string"/>
<xs:element name="EmailId" type="xs:string"/>
<xs:element name="UserType" type="xs:string"/>
<xs:element name="IsInternal" type="xs:string"/>
<xs:element name="IsDeleted" type="xs:string"/>
</xs:sequence>
</xs:complexType>
</xs:element>
</xs:sequence>
</xs:complexType>
</xs:element>
</xs:schema>]]>
</schema>
</report_schema>
```

Chapter 3: Types of Reports

This section contains the following topics

[Report on Catalogs](#) (see page 18)

[Report on Model Objects](#) (see page 20)

[Report on Users](#) (see page 29)

[Report on Locks](#) (see page 31)

[Report on Profiles](#) (see page 33)

[Report on Profile Assignments](#) (see page 34)

[Report on Permissions](#) (see page 35)

[Report on Permission Assignment](#) (see page 36)

[Report on Actions](#) (see page 37)

[Report on Securables](#) (see page 38)

Report on Catalogs

The following types of Catalog objects are present in Mart:

- Mart
- Library
- Model
- Version

Follow these steps:

1. Edit the reports.xml file and include the report definition for the Catalog objects and their properties that you want to report on.
2. Edit the reports_schema.xml file and include the schema definition for the report. You can also generate the schema definition using a tool of your choice and include it in the reports_schema.xml file.

The following report definition script reports on the Catalog table that includes Model and Versions:

```
<report>

  <Name>Library Model Version</Name>

  <Catalog_Type>

    <Name>Model</Name>

    <Report_Output>

      <Property>

        <Type>Catalog_Name</Type>

        <Type>Catalog_Path</Type>

      </Property>

    </Report_Output>

  </Catalog_Type>

  <Name>Version</Name>

  <Report_Output>

    <Property>

      <Type>Catalog_Name</Type>

    </Property>

  </Report_Output>

</report>
```

```

    </Report_Output>

    </Catalog_Type>

</Catalog_Type>

</report>

```

The list of Type tags or valid column values are listed below:

| Column Name | Description |
|-------------------|--|
| Id | Unique identifier for the catalog |
| Name | Name of the catalog item |
| Type | Type of the catalog |
| Container_Id | Owner of the catalog item |
| Catalog_Name | Name of the catalog item |
| Catalog_Path | Complete path for the catalog item not including the name of the catalog item in context |
| Catalog_FullPath | Complete path for the catalog item including the name of the catalog item in context |
| Catalog_Container | Name of the owner of the catalog item |
| Description | Description of the catalog |
| CreatedOn | Date and time identifying the catalog creation |
| UpdatedOn | Date and time identifying the catalog latest update |
| User_Id | User identifier responsible for creating the catalog item |
| LongId | Identifier for the catalog |
| Version | Version number for the catalog item |

Report on Model Objects

You can report on modeling objects using the object names and property names. The list of object names is available in the file `MartServer\WEB-INF\Metadata\EMX_ObjectTypecodeList.csv`. The list of property names is available in the file `MartServer\WEB-INF\Metadata\EMX_PropertyTypecodeList.csv`.

Follow these steps:

1. Edit the `reports.xml` file and include the report definition for the Model objects and their properties that you want to report on.
2. Edit the `reports_schema.xml` file and include the schema definition for the report. You can also generate the schema definition using a tool of your choice and include it in the `reports_schema.xml` file.

The following report definition script reports on the Object table that includes Entity and Attributes:

```
<report>
    <Name>Entity Attributes</Name>
    <Object_Type>
        <Name>Entity</Name>
        <Report_Output>
            <Property>
                <Type>Name</Type>
                <Type>Physical_Name</Type>
                <Type>Catalog_Name</Type>
                <Type>Catalog_Path</Type>
            </Property>
        </Report_Output>
    </Object_Type>
    <Name>Attribute</Name>
    <Report_Output>
        <Property>
            <Type>Name</Type>
        </Property>
    </Report_Output>
</report>
```

```

    <Type>Physical_Name</Type>

    <Type>Logical_Data_Type</Type>

    <Type>Physical_Data_Type</Type>

  </Property>

</Report_Output>

</Object_Type>

</Object_Type>

</report>

```

The list of Type tags or valid column values are listed below.

| Column Name | Description |
|-------------------|---|
| Catalog_Container | Identifier for the catalog item mapped into the object table |
| Id | GDM identifier for the object |
| Object_Type | Type of the object |
| Property | Here we mention the property name to report on for example to report on GDMTypes::pName mention Name here |
| Catalog_Name | Name of the catalog item |
| Catalog_Path | Complete path for the catalog item not including the name of the catalog item in context |
| Catalog_FullPath | Complete path for the catalog item including the name of the catalog item in context |
| Catalog_Container | Name of the owner of the catalog item |
| Start_Version | The version that the object was created on |

Additional Support for Object Type Reporting

Apart from reporting on Objects and Properties, you may need to generate other reports that need different XML elements. This section describes how you can generate reports for special requirements.

Alias

When generating report data in XML, the element name is the same as that defined in the <Name> element. There may be cases when you require a different name for the element name. In such cases, use the <Alias>Alias_Name</Alias> tag to set the name of the element as that defined in the Alias in the output XML. Use this name when you refer to the element in the schema and not the name defined within the <Name> element.

Syntax:

```
<Alias>Alias_Name</Alias>
```

All Objects Support

To report on an object type, use that object type within the <Name> element. To report on all objects in Mart, do not define the <Name> element.

In the example script given below, the type of object for which the report is generated is not mentioned. This script generates a report on all objects returning the object type, name, and definition. Remember to add the Alias tag.

Syntax:

```
<report>  
  
  <Name>Definitions</Name>  
  
  <Object_Type>  
  
    <Alias>Objects</Alias>  
  
    <Report_Output>  
  
      <Property>  
  
        <Type>Object_Type</Type>  
  
        <Type>Name</Type>  
  
        <Type>Definition</Type>  
  
      </Property>  
  
    </Report_Output>  
  
  </Object_Type>  
  
</report>
```

Sub Object Type Support

For reporting on a specific object type in a specific context, we include the <Object_Type> tag within the parent <Object_Type> element. The supports within the sub object type support are as follows:

Child

When you define an object type within an existing object type, the child items of that specific type are reported. For example, if you report on an object type that reports an entity that defines an object type of Attribute, then the report includes all attributes within that entity. This is the default way in which Mart reporting is implemented.

Syntax:

```
<report>
  <Name>Entity Attributes</Name>
  <Object_Type>
    <Name>Entity</Name>
    <Report_Output>
      <Property>
        <Type>Name</Type>
      </Property>
    </Report_Output>
  <Object_Type>
    <Name>Attribute</Name>
    <Report_Output>
      <Property>
        <Type>Name</Type>
      </Property>
    </Report_Output>
  </Object_Type>
</Object_Type>
</report>
```

Owner

To refer to the Owner object in the context of an object type, use the Relationship attribute that refers to "Owner". For example, when you report on an object type that includes a domain and defines an object type of Model with relationship attribute as "Owner," then the report is generated on the Model owning the Domain.

Syntax:

```
<report>

<Name>Domains</Name>

<Object_Type>

  <Name>Domain</Name>

    <Report_Output>

      <Property>

        <Type>Name</Type>

      </Property>

    </Report_Output>

  <Object_Type Relationship = "Owner">

    <Name>Model</Name>

      <Report_Output>

        <Property>

          <Type>Name</Type>

        </Property>

      </Report_Output>

    </Object_Type>

  </Object_Type>

</report>
```

Referenced Object

To refer to an object that is referenced using a reference property within the object in context, use the Relationship attribute as "Ref" and define another attribute Reference that indicates the reference property to consider on the object while retrieving the object type defined within the current object type element. For example, within an object type reporting on Attribute defining an object type of Domain with relationship attribute as "Ref" and the Reference attribute defined as "Parent_Domain_Ref" would report on the Attribute and the Domain referenced by the property "Parent_Domain_Ref" on the Attribute in context.

Syntax:

```
<report>

<Name>Attribute Domains</Name>

<Object_Type>

  <Name>Attribute</Name>

    <Report_Output>

      <Property>

        <Type>Name</Type>

      </Property>

    <Report_Output>

<Object_Type Relationship = "Ref" Reference = "Parent_Domain_Ref">

  <Name>Domain</Name>

    <Report_Output>

      <Property>

        <Type>Name</Type>

      </Property>

    <Report_Output>

  </Object_Type>

</Object_Type>

</report>
```

Applying Conditions

Sometimes, you apply conditions to filter data. When you apply conditions, the efficiency of reports is improved, as conditions remove the invalid objects in context in the output XML. The conditions are applied on the object in context. As given in the example below, the `<Condition Compare="Comparison_Strategy">` tag is defined within the `<Object_Type>` tag. The "Compare" attribute defines the comparison strategy.

The comparison strategy defines the following strategies:

- Exact: Compares with the exact value defined in the `<Value>` tag.
- BeginsWith: Value begins with the value defined in the `<Value>` tag.
- EndsWith: Value ends with the value defined in the `<Value>` tag.
- Contains: Value contains with the value defined in the `<Value>` tag.
- NotEqual: Value does not match the value defined in the `<Value>` tag.
- Null: Property value is NULL. The `<Value>` tag is not required in this strategy.
- NotNull: Property value exists. The `<Value>` tag is not required in this strategy.

Syntax:

```
<Object_Type>
  <Name>Attribute</Name>
  <Condition Compare = "Exact">
    <Property>
      <Type>Tpye</Type>
      <Value>0</Value>    <!--0 = PK Attribute Type-->
    </Property>
  </Condition>
  <Report_Output>
    <Property>
      <Type>ID</Type>
      <Type>Parent_Relationship_Ref</Type>
    </Property>
  </Report_Output>
</Object_Type>
```

Property Type Alias

When generating report data in XML, the element name for a property is the same as that defined in the <Type> element. There may be cases when you require a different name for the element name; in such cases, use the <Type Alias = "Alias_Name" >Logical_Data_Type<Type> tag to set the name of the element as that defined in the Alias in the output XML. Use this name to refer to the element in the schema and not the name defined within the <Type> element.

Syntax:

```
<Type Alias = "Datatype">Logical_Data_Type</Type>
```

Property Inheritance Value

There may be a scenario when the property on an object is inherited. You can retrieve the inherited property value using the code example given below. The Reference attribute within the <Type> element defines the reference property to look into. The Object_Type attribute defines the corresponding object, whereas the Property attribute defines the property in the object to probe. The inheritance is drilled down until the property value is not null. For example, to retrieve the Name for Domain or Attributes where the Name property on the current domain or attribute is NULL then it gets the "Parent_Domain_Ref" on the current object, on that id it looks into for an object of type "Domain" with the id associated with "Parent_Domain_Ref" property and gets its property "Name". If it is NULL, it further looks into the "Parent_Domain_Ref" property on that object and likewise looks further up till the property is retrieved.

Syntax:

```
<Type Reference = "Parent_Domain_Ref" Object_Type = "Domain" Property = "Name">Name</Type>
```

UDP Reports

To generate a report on User Defined Properties (UDP) in Mart, use UDP in the <Name> element within the <Object_Type> attribute.

Follow these steps:

1. Edit the reports.xml file and include the report definition for the properties of UDPs that you want to report on.
2. Edit the reports_schema.xml file and include the schema definition for the report. You can also generate the schema definition using a tool of your choice and include it in the reports_schema.xml file.

The following example shows the report definition to report on UDPs and their properties:

Syntax:

```
<report>
  <Name>User-Defined Properties</Name>
  <Object_Type>
    <Name>Udp</Name>
    <Report_Output>
      <Property>
        <Type>Name</Type>
        <Type>tag_Udp_Default_Value</Type>
        <Type>tag_Udp_Owner_Type</Type>
        <Type>Catalog_Path</Type>
        <Type>Catalog_Name</Type>
      </Property>
    <Report_Output>
  </Object_Type>
</report>
```

Report on Users

This section describes how you can create the report definition for users.

Follow these steps:

1. Edit the reports.xml file and include the report definition for the properties of the User table that you want to report on.
2. Edit the reports_schema.xml file and include the schema definition for the report. You can also generate the schema definition using a tool of your choice and include it in the reports_schema.xml file.

The following example shows the report definition to report on the User table:

```
<report>
  <Name>Users</Name>
  <User>
    <Report_Output>
      <Property>
        <Type>ID</Type>
        <Type>Username</Type>
        <Type>EMailId</Type>
        <Type>UserType</Type>
        <Type>IsInternal</Type>
        <Type>IsDeleted</Type>
      </Property>
    </Report_Output>
  </User>
</report>
```

| Column Name | Description |
|-------------|--|
| Id | Unique identifier for the user |
| Username | Username |
| EMailId | Email address for the corresponding user |

| | |
|------------|--|
| UserType | Type of the User. The types basically are Server User Windows User Group User |
| IsInternal | Integer "1" indicating if the user is an internal user i.e. a windows user which was authenticated on being part of a group user |
| IsDeleted | Integer "1" indicating if the user is deleted and no long a valid Mart user |

Report on Locks

This section describes how you can create the report definition for locks.

Follow these steps:

1. Edit the reports.xml file and include the report definition for the properties of the Lock table that you want to report on.
2. Edit the reports_schema.xml file and include the schema definition for the report. You can also generate the schema definition using a tool of your choice and include it in the reports_schema.xml file.

The following example shows the report definition to report on the Lock table:

```
<report>
  <Name>Locks</Name>
  <Lock>
    <Report_Output>
      <Property>
        <Type>ID</Type>
        <Type>Catalog_ID</Type>
        <Type>Type</Type>
        <Type>Time</Type>
        <Type>User_ID</Type>
      </Property>
    </Report_Output>
  </Lock>
</report>
```

| Column Name | Description |
|-------------|---|
| Id | Unique identifier for the lock |
| Catalog_Id | Catalog identifier for which the lock is applicable |
| User_Id | User identifier that has acquired the lock |

| | |
|-----------|---|
| Cause | The identifier of the lock that has caused this lock |
| Type | Type of the current lock. The values: E: Existence S: Shared U: Update X: Exclusive |
| Isolation | Isolation level of the current lock. The values: C: This lock not only affects the current catalog but also all child entries of the catalog L: This lock only affects the current catalog |
| Time | Date and time when the lock was applied |

Report on Profiles

This section describes how you can create the report definition for profiles.

Follow these steps:

1. Edit the reports.xml file and include the report definition for the properties of the Profile table that you want to report on.
2. Edit the reports_schema.xml file and include the schema definition for the report. You can also generate the schema definition using a tool of your choice and include it in the reports_schema.xml file.

The following example shows the report definition to report on the Profile table:

```
<report>
  <Name>Profiles</Name>
  <Profile>
    <Report_Output>
      <Property>
        <Type>ID</Type>
        <Type>Name</Type>
        <Type>Description</Type>
        <Type>Is_BuiltIn</Type>
      </Property>
    </Report_Output>
  </Profile>
</report>
```

| Column Name | Description |
|-------------|--|
| Id | Unique identifier for the profile |
| Name | Name of the profile |
| Description | Description associated with the profile |
| Is_BuiltIn | Integer "1" indicating if the profile is a built-in profile. |

Report on Profile Assignments

This section describes how you can create the report definition for profile assignment.

Follow these steps:

1. Edit the reports.xml file and include the report definition for the properties of the Profile Assignment table that you want to report on.
2. Edit the reports_schema.xml file and include the schema definition for the report. You can also generate the schema definition using a tool of your choice and include it in the reports_schema.xml file.

The following example shows the report definition to report on the Profile Assignment table:

```
<report>
  <Name>Profile Assignments</Name>
  <Profile_Assignment>
    <Report_Output>
      <Property>
        <Type>Catalog_ID</Type>
        <Type>Profile_ID</Type>
        <Type>User_ID</Type>
      </Property>
    </Report_Output>
  </Profile_Assignment>
</report>
```

| Column Name | Description |
|-------------|---|
| Catalog_Id | Identifier for the catalog for which profile is assigned |
| Profile_Id | Identifier for the profile assigned |
| User_Id | Identifier for the User for which the profile is assigned |

Report on Permissions

This section describes how you can create the report definition for permissions.

Follow these steps:

1. Edit the reports.xml file and include the report definition for the properties of the Permission table that you want to report on.
2. Edit the reports_schema.xml file and include the schema definition for the report. You can also generate the schema definition using a tool of your choice and include it in the reports_schema.xml file.

The following example shows the report definition to report on the Permission table:

```
<report>
  <Name>Permissions</Name>
  <Permission>
    <Report_Output>
      <Property>
        <Type>ID</Type>
        <Type>Action_Name</Type>
        <Type>Securable_Name</Type>
      </Property>
    </Report_Output>
  </Permission>
</report>
```

| Column Name | Description |
|----------------|--|
| Id | Identifier for the permission |
| Action_Name | Action associated with the permission |
| Securable_Name | Securable associated with the permission |

Report on Permission Assignment

This section describes how you can create the report definition for permission assignments.

Follow these steps:

1. Edit the reports.xml file and include the report definition for the properties of the Permission Assignment table that you want to report on.
2. Edit the reports_schema.xml file and include the schema definition for the report. You can also generate the schema definition using a tool of your choice and include it in the reports_schema.xml file.

The following example shows the report definition to report on the Permission Assignment table:

```
<report>

  <Name>Permission Assignments</Name>

  <Permission_Assignment>

    <Report_Output>

      <Property>

        <Type>Profile_ID</Type>

        <Type>Permission_ID</Type>

      </Property>

    </Report_Output>

  </Permission_Assignment>

</report>
```

| Column Name | Description |
|---------------|--|
| Profile_Id | Profile identifier for the profile |
| Permission_Id | Permission identifier for the permission assigned on the profile |

Report on Actions

This section describes how to create the report definition for actions. The Action table stores the actions for a particular securable. For example, actions are View, Open, Save, and so on.

Follow these steps:

1. Edit the reports.xml file and include the report definition for the properties of the Action table that you want to report on.
2. Edit the reports_schema.xml file and include the schema definition for the report. You can also generate the schema definition using a tool of your choice and include it in the reports_schema.xml file.

The following example shows the report definition to report on the Action table:

```
<report>
  <Name>Actions</Name>
  <Action>
    <Report_Output>
      <Property>
        <Type>Name</Type>
        <Type>Display_Name</Type>
      </Property>
    </Report_Output>
  </Action>
</report>
```

| Column Name | Description |
|--------------|--|
| Name | Action identifier |
| Display_Name | Display name for the action identifier |

Report on Securables

This section describes how to create the report definition for securables. The Actions table stores the securables for a particular action. For example, actions are Mart, Model, Entity, User Management, and so on.

Follow these steps:

1. Edit the reports.xml file and include the report definition for the properties of the Securable table that you want to report on.
2. Edit the reports_schema.xml file and include the schema definition for the report. You can also generate the schema definition using a tool of your choice and include it in the reports_schema.xml file.

The following example shows the report definition to report on the Securable table.

```
<report>
  <Name>Actions</Name>
  <Securable>
    <Report_Output>
      <Property>
        <Type>Name</Type>
        <Type>Parent_Name</Type>
        <Type>Display_Name</Type>
      </Property>
    </Report_Output>
  </Securable>
</report>
```

| Column Name | Description |
|--------------|---|
| Name | Securable identifier |
| Parent_Name | Parent securable item if any |
| Display_Name | Display name for the securable identifier |
